

TP-SW8GBT/AT/PSV-U

L2 Managed 10 Port PoE Switch

CLI-based Configuration Guide

About This Document

This product includes three documents as the table below.

| Documents | Description | How to get it |
|-------------------------------|---|--------------------|
| Quick Guide | Including product introductions and installation steps. | In the packing box |
| Web-based Configuration Guide | Including Web network management system configuration instructions. | tyconsystems.com |
| CLI-based Configuration Guide | Including CLI-based configuration instructions | tyconsystems.com |

This document is **[CLI-based Configuration Guide](#)**, including CLI-based configuration instructions. It is intended for engineers or anyone who needs to configure the device by command line parameters.

The configuration instructions here take 24 ports switch as example. If there is inconsistency between the instruction (eg. port number) and the actual product, please refer to the actual product.

Announcement

The information in this document is subject to change without notice.

The document is only used as operation guide. No warranties of any kind, either express or implied are made in relation to the description, information or suggestion or any other contents of the manual.

The images shown here are indicative only. If there is inconsistency between the image and the actual product, the actual product shall govern.

Command line conventions

The command line conventions that may be found in this document are defined as follows.

| Convention | Description |
|----------------------------|---|
| Key word | The keywords of a command line are underlined in light blue, not in boldface. |
| Parameters | Command arguments are underlined in dark, not in boldface. |

Change History

Updates between document issues are cumulative. Therefore, the latest document issue contains all updates made in previous issues.

| Version | State | Release Date | Description |
|----------------|--------------|---------------------|--|
| V1.0 | Released | 2020-04-27 | Initial commercial release. |
| V2.0 | Released | 2020-12-07 | Correcting the command lines descriptions and adding “examples” and “checking the configuration” contents. |
| V3.0 | Released | 2024-06-05 | Add new requirement specifications. |

| 10.3 | Using IP Traceroute | 74 |

1 Login Through the Console Port

To configure a device that is powered on for the first time, log in to the device through the console port.

A main control board provides a console port. To configure a device, connect the user terminal serial port to the device console port.

After the device is powered on for the first time, you can log in to it from a PC through the console port to configure and manage the device.

1.1 Pre-configuration Tasks

Before logging in to the device through the console port, complete the following tasks:

Preparing the console cable

Installing the terminal emulation software on the PC

Note:

Users can use the built-in terminal emulation software (such as the HyperTerminal of Windows 10/11) on the PC. If no built-in terminal emulation software is available, use the third-party terminal emulation software.

1.2 Configuration Procedure

Use the terminal emulation software to log in to the device through the console port, and complete the basic configuration for the device.

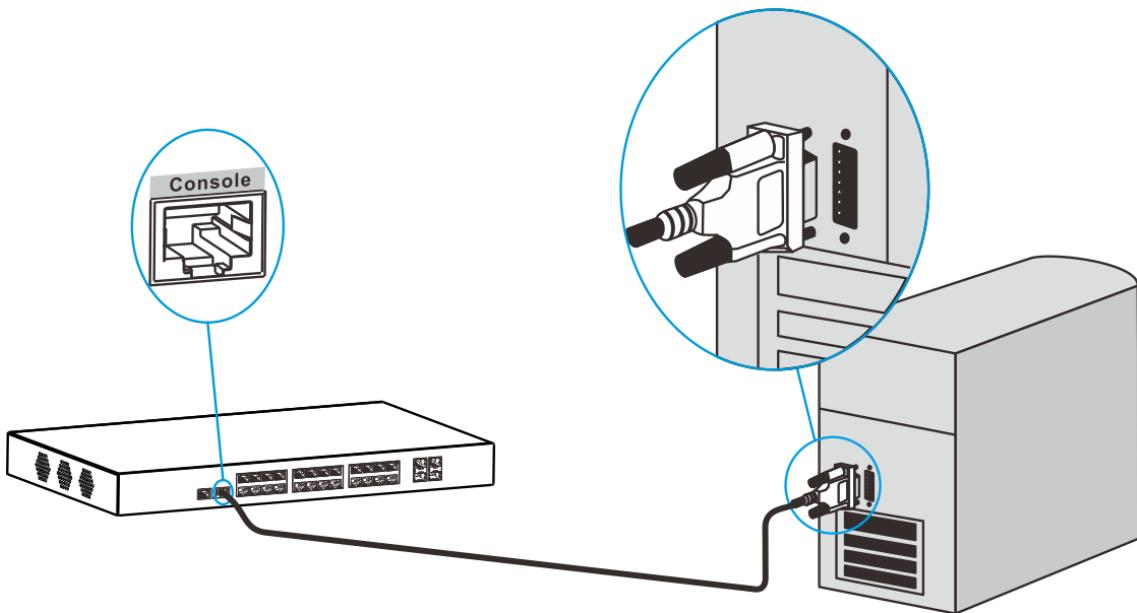

Default configuration

| Data | Default value |
|-------------------|---------------|
| Transfer rate | 115200 bit/s |
| Flow control mode | Not support |
| Test mode | Not support |
| Stop bits | 1 |
| Data bits | 8 |

Procedure

Use the terminal emulation software to log in to the device through the console port.

Insert the SUB-D9 connector of the console cable delivered with the product to the 9-pin serial port on the PC, and insert the RJ-45 connector to the console port of the device, as shown in the following figure.

Start the HyperTerminal (Microsoft Windows) or Terminal (Mac OS), and create a connection, set the connection port and communication parameter.

Note:

There are several ports on the PC, the one to be connected here is the port connecting with Console cable. Normally select the port COM1.

If the communication parameter for the serial port of the device is changed, please set the communication parameter in the PC the same value, and reconnect.

Enter until the following information is displayed.

User Access Verification!

Username:

Enter the default user name and password.

username: admin

password: admin

1.2.1 Configure Cable Connection

The way of cable connection and configuration of DIN rail switch is the same as that of rack type switch. Take DIN rail switch as an example here.

When the switch is configured through the terminal, the connection steps of cable configuration are as follows.

- Connect the SUB-D9 plug of the configured cable to the serial port of the PC to be configured for the switch.
- Connect the RJ-45 end of the configuration cable to the console port of the switch.

2 Cli Overview

2.1 Command Line Interface

The command line interface (CLI) is an interactive interface between a user and a device. A user can enter commands on the CLI to configure and manage a device and view the output of commands to verify the configuration.

Users can configure a device by clicking options in the graphical user interface (GUI), and also can enter more abundant commands in the CLI. The CLI is as follows:

User Access Verification!

username: admin

password: admin

Input default username and password, login the CLI. Users can enter commands on the command line interface to configure and manage a device.

2.2 Entering Command Views

After successful login, enter “?” or “help” to enter the users view. The command lines under this mode are displayed as followed.

The device provides various configuration commands and query commands to manage and maintain products. To facilitate the use of these commands, they must be classified into groups. Command line interfaces (CLIs) are classified into several command line views. All commands must be executed in command line views. Before a command is executed, the command line view where the command resides is displayed. Command views apply to different configurations.

Following with the main command views list of the device.

| Views | How to enter | Description |
|----------------|---|--|
| Users view | When a user logs in to the device, the user enters the user view. | In the user view, users can view the running status and statistics of the device. |
| Enable view | Enter users view. · Run: enable · Enter | In the enable view, users can look up and set the system parameters of the device, and enter other function views from this view. |
| Config view | Enter enable view. · Run: config · Enter | In the config view, users can set the global configuration of the device. |
| Interface view | Enter config view. · Run: interface interface_type interface_number · Enter | Users can configure interface parameters in the interface view. The interface parameters include physical attributes, link layer protocols, and IP addresses. Run the interface command and specify an interface type and number to enter an interface view. |

3 Checking the Configuration

After configuration, users can run the [show](#) command to check the configuration and running information on the device.

```
Switch_config# show ?
access-list          -- Named access-list
aggregator-group   -- Link Aggregation information
clock                -- current time
exec-timeout         -- The EXEC timeout
flow_interval        -- The flow_interval
history              -- History command
interface            -- Interface status and configuration
IP                  -- IP Configuration information
lldp                -- Show the lldp information
logging              -- Show the contents of logging buffers
loopback-status     -- show loopback port status
mac                 -- MAC configuration
memory              -- Memory information
mirror               -- Show a mirror session
mst-config          -- Show the configuration of MST
ntp                 -- Ntp infomation
policy-map           -- Show policy-map
process              -- Processes information
running-config      -- Current configuration
spanning-tree       -- Display spanning-tree state
startup-config      -- Startup configuration
ssh                 -- The LINES connected in
telnet              -- Show incoming telnet connection
version              -- Device version information
```

4 Interface Management Configuration

Interfaces of a device are used to exchange data and interact with other network devices. Interfaces are classified into management interface, physical interface, and logical interfaces as followed.

| Interfaces | Description |
|----------------------|---|
| Management interface | Management interfaces are used to log in to devices. Users can use management interfaces to configure and manage devices. Management interfaces do not transmit service data. |
| Physical interface | Physical interfaces exist on interface cards and transmit service data. |
| Logical interfaces | Logical interfaces are manually configured and do not physically exist. They can be used to exchange data and transmit service data. |

4.1 Choose Port Range

Before configuring the port, first choose the port range that need to be configured.

| | |
|-------------------------------|---|
| Command | Interface interface type interface number |
| Parameter Descriptions | <ul style="list-style-type: none">· <u>interface type</u> : interface type, including GigaEthernet -- GigaEthernet interface TenGigaEthernet -- TenGigaEthernet interface· <u>interface number</u>: interface number, in the format as “0/port number”, the value of port number value is the port number of the switch. |
| Procedure | <ul style="list-style-type: none">· Enter interface view. Run: Interface interface type interface number Enter |
| Example | Switch> enable Switch# config Switch_config# interface gigaetherent 0/24 switch_config_g0/24# |

4.2 Enable/Disable Port

The port is off by default. Using the command line, users can enable the port.

| | |
|-------------------------------|---|
| Command | no shutdown |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none">· Enter interface view. Run: Interface gigaEthernet 0/24 Enter· Run: no shutdown Enter |
| Example | switch_config_g0/24# no shutdown switch_config_g0/24# |
| · Disable the port | |
| Command | shutdown |

| | |
|-------------------------------|---|
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> Enter interface view. <p>Run: Interface gigaEthernet 0/24</p> <p>Enter</p> <ul style="list-style-type: none"> Run: shutdown <p>Enter</p> |
| Example | switch_config_g0/24# shutdown switch_config_g0/24# |

4.3 Configure Port

- Change port description

| | |
|-------------------------------|--|
| Command | description description |
| Parameter Descriptions | <ul style="list-style-type: none"> dsescription: The description of the port, supporting 31-string. No default value. |
| Procedure | <ul style="list-style-type: none"> Enter interface view. <p>Run: description description</p> <p>Enter</p> |
| Example | switch_config_g0/24# description switch 1 switch_config_g0/24# |

- Configure port speed

| | |
|-------------------------------|---|
| Command | speed speed |
| Parameter Descriptions | <ul style="list-style-type: none"> speed: the speed of the port, supporting 10M, 100M, 1000M. The device speed is auto by default. |
| Procedure | <ul style="list-style-type: none"> Enter interface view. <p>Run: speed speed</p> <p>Enter.</p> |
| Example | switch_config_g0/24# speed 1000 switch_config_g0/24# |

- Switch the port speed to auto

| | |
|-------------------------------|--|
| Command | speed auto |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> Enter interface view. <p>Run: speed auto</p> <p>Enter.</p> |
| Example | switch_config_g0/24# speed auto switch_config_g0/24# |

4.4 Configure Duplex Mode

The device is working in auto-duplex mode by default.

Using the command line, users can switch the mode by Auto, Full and Half.

| | |
|-------------------------------|--|
| Command | duplex auto duplex Full duplex Half |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none">Enter interface view. Run: duplex autoEnter |
| Example | switch_config_g0/24# duplex auto switch_config_g0/24# switch_config_g0/24# duplex full switch_config_g0/24# switch_config_g0/24# duplex half switch_config_g0/24# |

4.5 Configure Rate Limit

Configure the rate-limit of ingress and egress ports.

- Configure port rate-limit ingress

| | |
|-------------------------------|--|
| Command | switchport rate limit speed ingress |
| Parameter Descriptions | <ul style="list-style-type: none">speed: Limit the rate of port(Kbps), the value ranges from 64~1000000. |
| Procedure | <ul style="list-style-type: none">Enter interface view.Run: switchport rate-limit speed ingressEnter |
| Example | Switch_config_g0/24# switchport rate-limit 1000 ingress Switch_config_g0/24# |

- Configure port rate-limit egress

| | |
|-------------------------------|---|
| Command | switchport rate-limit speed egress |
| Parameter Descriptions | <ul style="list-style-type: none">speed: Limit the rate of port(Kbps), the value ranges from 64~1000000. |
| Procedure | <ul style="list-style-type: none">Enter interface view.Run: switchport rate limit speed egressEnter |
| Example | Switch_config_g0/24# switchport rate-limit 1000 egress Switch_config_g0/24# |

4.6 Storm Control Configuration

Storm control prevents broadcast storms.

When receiving broadcast packets, multicast packets, and unknown unicast packets, the Switch forwards the packets to other Layer 2 Ethernet interfaces in the same VLAN. This is because the switch cannot determine the outbound interface based on destination MAC addresses of packets. In this case, broadcast storms may occur on the network and forwarding performance of the switch deteriorates.

Storm control can control these packets and prevent broadcast storms.

- Configuring broadcast packets

| | |
|-------------------------------|---|
| Command | storm-control broadcast threshold packet storm control |
| Parameter Descriptions | <ul style="list-style-type: none">· <u>packet storm control</u>: ranges from 1 to 1000, the unit is 64kbps. |
| Procedure | <ul style="list-style-type: none">· Enter interface view. Run: storm-control broadcast threshold packet storm control Enter |
| Example | switch_config_g0/24# storm-control broadcast threshold 100 switch_config_g0/24# |

- Configuring multicast packets

| | |
|-------------------------------|---|
| Command | storm-control multicast threshold packet storm control |
| Parameter Descriptions | <ul style="list-style-type: none">· <u>packet storm control</u>: ranges from 1 to 1000, the unit is 64kbps. |
| Procedure | <ul style="list-style-type: none">· Enter interface view. Run: storm-control multicast threshold packet storm control Enter |
| Example | switch_config_g0/24# storm-control multicast threshold 100 switch_config_g0/24# |

- Configuring unicast packets

| | |
|-------------------------------|---|
| Command | storm-control unicast threshold packet storm control |
| Parameter Descriptions | <ul style="list-style-type: none">· <u>packet storm control</u>: ranges from 1 to 1000, the unit is 64kbps. |
| Procedure | <ul style="list-style-type: none">· Enter interface view. Run: storm-control unicast threshold packet storm control Enter |
| Example | switch_config_g0/24# storm-control unicast threshold 100 switch_config_g0/24# |

4.7 Configure Flow Control

The flow control function is off by default.

Using the command, users can turn it off or on.

| | |
|-------------------------------|---|
| Command | flow-control on/off |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> . Enter interface view. <p>Run: flow-control on</p> <p>Enter.</p> |
| Example | <pre>switch_config_g0/24# flow-control on switch_config_g0/24# switch_config_g0/24# flow-control off switch_config_g0/24#</pre> |

4.8 Configure Port Isolation

The port isolation mode is normal by default.

Using the command line, users can isolate the physical ports.

| | |
|-------------------------------|---|
| Command | switchport protected |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> . Enter interface view. <p>Run: switchport protected</p> <p>Enter</p> |
| Example | <pre>switch_config_g0/24# switchport protected switch_config_g0/24#</pre> |

4.9 Configure Jumbo Frame Size

The port maximal supports 13000 bytes for Jumbo Frame.

Using the command line, users can change the size.

| | |
|-------------------------------|---|
| Command | mtu jumbo size |
| Parameter Descriptions | <ul style="list-style-type: none"> . <u>Size</u>: the jumbo frame size, ranges from 1522~13000 bytes. |
| Procedure | <ul style="list-style-type: none"> . Enter interface view. <p>Run: mtu jumbo size</p> <p>Enter</p> |
| Example | <pre>switch_config_g0/24# mtu jumbo 9000 switch_config_g0/24#</pre> |

4.10 Clear Interface Traffic Statistics

To monitor the status of an interface or locate faults on the interface, collect traffic statistics on the interface. Before collecting traffic statistics on an interface within a period, clear the existing traffic statistics on this interface.

Interface statistics cannot be restored after they are cleared. Please confirm your action before you perform the operations.

- Clearing Interface Traffic Statistics

| | |
|-------------------------------|---|
| Command | clear counters |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter enable view. <p>Run: clear counters</p> <p>Enter.</p> |
| Example | <pre>Switch# clear counters Switch#</pre> |

4.11 Link Aggregation Configuration

Link aggregation is a technology that bundles a group of physical interfaces into a logical interface to increase link bandwidth.

As the network scale expands increasingly, users propose increasingly higher requirements on the bandwidth and reliability of backbone links. Traditional technologies often use high-speed cards or devices supporting high-speed interface cards to increase the bandwidth. This method, however, is costly and inflexible.

Through the three operations, users could bundle a group of physical interfaces into a logical interface to increase link bandwidth.

Following will describe the command lines and procedures of the three operations.

- Creating link aggregator group

| | |
|-------------------------------|--|
| Command | interface port-aggregator INTERFACE |
| Parameter Descriptions | INTERFACE: <1-6> -- Port-aggregator interface number |
| Procedure | <ul style="list-style-type: none"> · Enter interface view. <p>Run: interface truck-name INTERFACE</p> <p>Enter.</p> |
| Example | <pre>switch_config_g0/7# interface port-aggregator 2 switch_config_g0/7 interface port-aggregator 2 switch_config_t2#</pre> |

- Configuring load pattern mode of link aggregator group

| | |
|-------------------------------|--|
| Command | aggregator-group load-balance mode |
| Parameter Descriptions | <ul style="list-style-type: none"> · mode: The load balance modes, including <ol style="list-style-type: none"> 1) src-mac 2) dst-mac 3) both-mac 4) src-ip 5) dst-ip 6) both-ip 7) src-port 8) dst-port |

| | |
|--|--|
| Procedure | <ul style="list-style-type: none"> Exit and enter config view. <p>Run: aggregator-group load-balance mode</p> <p>Enter</p> |
| · Configuring working mode of link aggregator group and members of link aggregator group | |
| Command | aggregator-group GROUPID |
| Parameter Descriptions | <ul style="list-style-type: none"> GROUPID: <1-8> -- Aggregator group number |
| Procedure | <ul style="list-style-type: none"> Enter interface view. <p>Run: aggregator-group GROUP</p> <p>Enter.</p> |
| Example | <pre>switch_config# interface giga ethernet 0/24 switch_config_g0/24# aggregator-group 1 switch_config_g0/24#</pre> |
| Command | port link-aggregation group MODE |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> Enter interface view. <p>Run:</p> <p>Enter.</p> |
| Example | <pre>switch_config# interface giga ethernet 0/24 switch_config_g0/24# port link-aggregation group auto switch_config_g0/24#</pre> |
| · Checking the configuration. | |
| Command | show aggregator-group summary |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> Enter interface view. <p>Run: show aggregator-group summary</p> <p>Enter</p> |
| Example | <pre>switch_config_g0/7# show aggregator-group summary Flags: D - down A - Use In port-aggregator U - Up I - Not In port-aggregator Group mode Port-aggregator Ports -----+-----+-----+ 1 lacp Po1(D) 2 Po2(D) 3 static Po3(D) G0/7(DI) switch_config_g0/7#</pre> |

4.12 VLAN Configuration

The VLAN technology enables a physical LAN to be divided into multiple broadcast domains, each

of which is called a VLAN.

The Ethernet technology is used to share communication media and data based on the Carrier Sense Multiple Access/Collision Detection (CSMA/CD). If there are a large number of hosts on an Ethernet network, collision becomes a serious problem and can lead to broadcast storms. Switches can be used to connect LANs, preventing collision. However, broadcast packets cannot be isolated.

The VLAN technology divides a physical LAN into multiple broadcast domains, each of which is called a VLAN. Hosts within a VLAN can communicate with each other, while hosts in different VLANs cannot communicate with each other directly. Therefore, the broadcast packets are limited in each VLAN.

The device supports port-based VLAN assignment function. Users in the same VLAN can communicate with each other.

- Choose the port range.

| | |
|-------------------------------|--|
| Command | Interface interface type interface number |
| Parameter Descriptions | <ul style="list-style-type: none"> interface type : interface type, including GigaEthernet -- GigaEthernet interface TenGigaEthernet -- TenGigaEthernet interface interface number: interface number, in the format as “0/port number”, the value of port number value is the port number of the switch. |
| Procedure | <ul style="list-style-type: none"> Enter interface view. Run: interface gigaEthernet 0/port number Or run: interface ten gigaEthernet 0/port number Enter |
| Example | Switch_config# interface gigaEthernet 0/24 Switch_config_g0/24# |

- Configure the port mode

| | |
|-------------------------------|---|
| Command | switchport mode mode |
| Parameter Descriptions | <ul style="list-style-type: none"> mode : Switch port modes, including 1) access, Access mode 2) trunk, Trunk mode |
| Procedure | <ul style="list-style-type: none"> Enter interface view. Run: switchport mode mode Enter |
| Example | Switch_config_g0/24# switchport mode trunk Switch_config_g0/24# |

- Configure PVID

| | |
|-------------------------------|--|
| Command | switchport pvid VLAN ID |
| Parameter Descriptions | <ul style="list-style-type: none"> VLAN ID: VLAN ID of the VLAN, ranges from 1~4094 |
| Procedure | <ul style="list-style-type: none"> Enter interface view. Run: switchport pvid VLAN ID |

| | |
|--------------------------------|---|
| | Enter |
| Example | Switch_config_g0/24# switchport pvid 10 Switch_config_g0/24# |
| · Configure port vlan-allowed | |
| Command | switchport trunk vlan-allowed VLAN ID |
| Parameter Descriptions | · VLAN ID: VLAN ID range is 2~100 |
| Procedure | · Enter interface view. Run: switchport trunk vlan-allowed VLAN ID Enter |
| Example | Switch_config_g0/24# switchport trunk vlan-allowed 12 Switch_config_g0/24# |
| · Configure port vlan-untagged | |
| Command | switchport trunk vlan-untagged VLAN ID |
| Parameter Descriptions | · VLAN ID: VLAN ID range is 10~50 |
| Procedure | · Enter interface view. Run: switchport trunk vlan-untagged VLAN ID Enter |
| Example | Switch_config_g0/24# switchport trunk vlan-untagged 13 Switch_config_g0/24# |
| · Checking the configuration. | |
| Command | show vlan interface interface type interface number |
| Example | Switch_config_g0/24# show vlan interface gigaEthernet 0/24 Interface VLAN Name Property PVID Vlan-allowed Vlan-untagged ----- ----- --- ----- ----- GigaEthernet0/24 trunk 10 12 13 Switch_config_g0/24# |
| · Configure VLAN Mapping | |
| Command | vlan mapping ID |
| Parameter Descriptions | Null |
| Procedure | · Enter interface view. Run: Enter. |
| Example | config_g0/1# vlan mapping ID translated-vlan ID |
| · Enable Voice VLAN | |
| Command | voice-vlan enable |

| | |
|--|---|
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> Enter config view. Run: voice-vlan enable Enter. |
| Example | <pre>switch_config# voice-vlan enable switch_config#</pre> |
| · Configure Voice VLAN And MAC Address | |
| Command | <code>voice-vlan mac-address ADDRESS mask MASK mode MODE</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> ADDRESS: HH:HH:HH:HH:HH:HH -- 48 bit mac MASK: HH:HH:HH:HH:HH:HH -- OUI mask MODE: <ul style="list-style-type: none"> auto -- auto mode manual -- manual mode AGING-TIME: 5-43200 (It is available when mode is auto) The default is 1440. The units is minutes. |
| Procedure | <ul style="list-style-type: none"> Enter interface view. Run: voice-vlan mac-address ADDRESS mask MASK mode MODE auto aging-time time Enter. |
| Example | <pre>switch_config_g0/7# voice-vlan mac-address 00:00:00:00:22:22 mask ff:ff:ff:ff:ff:ff mode auto aging-time 5 switch_config_g0/7#</pre> |

4.13 QinQ Setting

QinQ, also known as VLAN stacking or VLAN-in-VLAN, is a feature on switches that allows multiple VLAN tags to be encapsulated within another VLAN tag. This facilitates the creation of hierarchical VLAN structures, enhancing network scalability and isolation.

- Enable QinQ

| | |
|-------------------------------|--|
| Command | <code>dot1q-tunnel</code> |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> Enter config view. Run: Enter. |
| Example | <code>switch_config# dot1q-tunnel</code> |
| · Configure Port QinQ Mode | |
| Command | <code>switchport dot1q-translating-tunnel mode MODE</code> |

| | |
|-------------------------------|---|
| Parameter Descriptions | <ul style="list-style-type: none"> · MODE: <ul style="list-style-type: none"> · serviceprovider -- Select switching mode as ServiceProvider · customer -- Double tag customer mode · flat -- Select switching mode as Vlan Translate |
| Procedure | <ul style="list-style-type: none"> · Enter interface view. Run: switchport dot1q-translating-tunnel mode MODE Enter. |
| Example | <pre>switch_config# interface gigaethernet 0/24 switch_config_g0/24# switchport dot1q-translating-tunnel mode flat switch_config_g0/24#</pre> |
| · Enable global TPID | |
| Command | <code>dot1q-tunnel tpid</code> TPID |
| Parameter Descriptions | <p>TPID :</p> <p>WORD -- TPID tag must be set 4 Hex number, such as '9100' or '8100'</p> |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: <code>dot1q-tunnel tpid</code> TPID Enter. |
| Example | <pre>switch_config# dot1q-tunnel tpid 9300 switch_config#</pre> |

4.14 Qos Configuration

Packets carry different priority fields on various networks. For example, packets carry the 802.1p field in a VLAN and the DSCP field on an IP network. The mapping between the priority fields must be configured on the network devices to retain priorities of packets when the packets traverse different networks. When the device functions as the gateway between different networks, the external priority fields (including 802.1p and DSCP) of all packets received by the device are mapped to the internal priorities. When the device sends packets, it maps the internal priorities to external priorities.

While the QoS function is on, the device port trusts DSCP priority, and trust 802.1p secondary by default, which is not supported configuring.

DSCP priority

When receiving a packet, the device searches the mapping table for the DSCP priority of the packet, and then tags the packet with the mapping inner priority.

802.1p priority

When receiving a tagged packet, the device searches the mapping table for the 802.1p priority of the packet, and then tags the packet with the mapping inner priority. When receiving an untagged packet, the device searches the mapping table based on the default 802.1p priority, and then tags the packet with the mapping inner priority.

The device supports to configure the following features:

- Priority mapping
- Congestion management
- Traffic policy

4.14.1 Enable QoS

| | |
|-------------------------------|---|
| Command | <code>qos</code> |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> Enter config view. Run: <code>qos</code> Enter. |
| Example | <pre>switch_config# qos switch_config#</pre> |

4.14.2 Configuring QoS Trust Type

| | |
|-------------------------------|---|
| Command | <code>qos trust TRUST</code> |
| Parameter Descriptions | <p>TRUST :</p> <ul style="list-style-type: none"> <code>dot1p</code> -- Config Qos trust dot1p <code>dscp</code> -- Config Qos trust dscp |
| Procedure | <ul style="list-style-type: none"> Enter config view. Run: <code>qos trust TRUST</code> Enter. |
| Example | <pre>switch_config# qos trust dscp switch_config# qos trust dot1p switch_config#</pre> |

4.14.3 Configuring QoS Scheduler Policy

| | |
|-------------------------------|---|
| Command | <code>scheduler policy POLICY</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> POLICY: <code>sp</code> -- Schedule policy is sp <code>wrr</code> -- Schedule policy is wrr <code>drr</code> -- Schedule policy is drr <code>wfq</code> -- Schedule policy is wfq <code>wred</code> -- Schedule policy is wred |
| Procedure | <ul style="list-style-type: none"> Enter config view. Run: <code>scheduler policy POLICY</code> Enter. |
| Example | <pre>switch_config# scheduler policy sp switch_config# scheduler policy wrr switch_config#</pre> |

4.14.4 Configuring Priority Mapping

Priority mapping maps QoS priorities in packets to internal priorities (local priorities assigned by the device to packets) to ensure QoS in the differentiated services (DiffServ) model based on internal priorities.

Packets carry different priority fields on various networks. For example, packets carry the 802.1p field in a VLAN and the DSCP field on an IP network. The mapping between the priority fields must be configured on the network devices to retain priorities of packets when the packets traverse different networks. When the device functions as the gateway between different networks, the external priority fields (including 802.1p and DSCP) of all packets received by the device are mapped to the internal priorities. When the device sends packets, it maps the internal priorities to external priorities.

The device supports mapping between internal priorities and inbound queue indexes: This mapping allows packets to be sent to different queues, implementing differentiated services.

- Configuring mapping of 802.1p COS priority

| | |
|-------------------------------|--|
| Command | cos map queue number priority cos value |
| Parameter Descriptions | <ul style="list-style-type: none"> <u>queue number</u>: ranges from 1 to 8 <u>priority cos value</u>: ranges from 0 to 7 |
| Procedure | <ul style="list-style-type: none"> Enter config view. Run: cos map queue number priority cos value |
| Example | switch_config# cos map 1 2 switch_config# |

- Configuring mapping of DSCP priority

| | |
|-------------------------------|--|
| Command | dscp map queue number DSCP value |
| Parameter Descriptions | <ul style="list-style-type: none"> <u>queue number</u>: ranges from 1 to 8 <u>DSCP value</u>: ranges from 0 to 63, format as "1"/"1-10". |
| Procedure | <ul style="list-style-type: none"> Enter config view. Run: network IP address |
| Example | Example 2 Configuring mapping of DSCP priority switch_config# dscp map 1 2 switch_config# |

- Checking the configuration.

| | |
|----------------|--|
| Command | show running-config |
| Example | <pre>Switch_config# show running-config Building configuration. Current Configuration: !version 1.1.3c_M28P_B4M_T0 Switch_config# show running-config Building configuration. Current Configuration:</pre> |

| | | |
|--|---|---|
| | <pre> !version 1.1.3a_M28_B4M_T1 username admin password 0 admin no spanning-tree spanning-tree rstp priority 4096 IP IGMP Snooping IP IGMP Snooping querier mac address-table aging-time 1000 dscp enable dot1q-tunnel qos enable qos dot1p enable cos map 0 8 qos dscp enable dscp map 0 1 dscp map 1 1 dscp map 2 1 dscp map 3 1 dscp map 4 1 dscp map 5 1 dscp map 6 1 dscp map 7 1 --More-- </pre> | ! |
|--|---|---|

4.14.5 Congestion Management Configuration

After configuring congestion management, when there is congestion in the network, to process higher priority packet first, the device will decide the packet forwarding queue based on the setting scheduling policy.

The default scheduling policy is SP scheduling.

The device supports the following scheduling policy.

- SP scheduling (Strict Priority)
- WRR scheduling (Weighted Round Robin)
- DRR scheduling (Deficit Round Robin)
- WFQ scheduling (Weighted Fair Queuing)
- WRED scheduling (Weighted Random Early Detection)

Following with the steps.

- Configuring scheduler policy

| | |
|-------------------------------|--|
| Command | <u>scheduler policy sp</u> |
| | <u>scheduler policy wrr</u> |
| | <u>scheduler policy drr</u> |
| | <u>scheduler policy wfq</u> |
| | <u>scheduler policy wred</u> |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter config view. |

| | |
|-------------------------------|--|
| | <ul style="list-style-type: none"> Run: scheduler policy sp Or scheduler policy wrr Or scheduler policy drr Or scheduler policy wfq Or scheduler policy wred <p>Enter</p> |
| Example | switch_config# scheduler policy wfq switch_config# |
| · Checking the configuration. | |
| Command | show running-config |
| Example | <pre>Switch_config# show running-config Building configuration. Current Configuration: ! !version 1.1.3a_M28_B4M_T1 ! username admin password 0 admin ! no spanning-tree ! scheduler policy wfq --More--</pre> |

4.14.6 Traffic Policy Configuration

A traffic policy identifies packets of a certain type so that the device can provide differentiated services for these packets.

In the traditional IP network, network devices use the first-in-first-out (FIFO) policy to process all packets and send packets to the destination on a best-effort basis, but cannot guarantee transmission performance such as reliability and latency. Along with emergence of new applications in IP networks, new requirements are raised to QoS of IP networks. For example, delay-sensitive services such as VoIP services and video services demand shorter delay. Email and the File Transfer Protocol (FTP) services are insensitive to the delay.

The traditional IP network cannot provide differentiated services because the BE mode cannot distinguish services. That is, the BE mode cannot meet requirements of applications. A traffic policy solves this problem. The traffic policy classifies traffic based on rules, differentiates different service types, and provides corresponding network services. This function implements differentiated services and improves service provision capabilities.

The configuring processes are as following:

- Creating traffic policy template
- Configuring the traffic classify
- Configuring the traffic behavior
- Apply the traffic policy to interfaces

Following with the steps.

- Creating traffic policy template

| | |
|-------------------------------|---|
| Command | policy-map policy map name |
| Parameter Descriptions | <ul style="list-style-type: none"> <u>policy map name</u>: name the policy map |

| | |
|------------------|--|
| Procedure | <ul style="list-style-type: none"> Enter config view. <p>Run: policy-map policy map name</p> <p>Enter</p> |
| Example | switch_config# policy-map 1 switch_policy_map# |

- Configuring the traffic classify

a) Classifies applying to Layer 2

| | |
|-------------------------------|--|
| Command | classify mac access-group access-list name |
| Parameter Descriptions | <u>access-list name</u> : access-list name |

| | |
|-------------------------------|--|
| Command | classify vlan VLAN ID |
| Parameter Descriptions | <ul style="list-style-type: none"> <u>VLAN ID</u>: ranges from 1 to 4094 |
| Procedure | <ul style="list-style-type: none"> Enter config view. <p>Run: policy-map policy map name</p> <p>Enter</p> <ul style="list-style-type: none"> Run: classify vlan VLAN ID <p>Enter</p> |
| Example | switch_config# policy-map 1 Switch_policy_map# classify vlan 1 Switch-classify# |

| | |
|-------------------------------|---|
| Command | classify cos cos value |
| Parameter Descriptions | <ul style="list-style-type: none"> <u>cos value</u>: cos value , ranges from 0 to 7 |
| Procedure | <ul style="list-style-type: none"> Enter config view. <p>Run: policy-map policy map name</p> <p>Enter</p> <ul style="list-style-type: none"> Run: classify cos cos value <p>Enter</p> |
| Example | switch_config# policy-map 1 Switch_policy_map# classify cos 1 Switch-classify# |

b) Classifies applying to Layer 3

| | |
|-------------------------------|---|
| Command | classify IP access-group IP access-list |
| Parameter Descriptions | <ul style="list-style-type: none"> <u>IP access-list</u>: IP access-list |

| | |
|-------------------------------|---|
| Command | classify dscp DSCP value |
| Parameter Descriptions | DSCP value: DSCP value, ranges from 0 to 63 |
| Procedure | <ul style="list-style-type: none"> Enter config view. Run: classify dscp DSCP value Enter |
| Example | <pre>switch_config# policy-map 1 switch_policy_map# classify DSCP 1 switch-classify#</pre> |

- No classify

| | |
|-------------------------------|------------------------------|
| Command | classify any |
| Parameter Descriptions | Null |

- Configuring the traffic behavior

a) Configuring bandwidth

| | |
|-------------------------------|--|
| Command | bandwidth bandwidth |
| Parameter Descriptions | <ul style="list-style-type: none"> Bandwidth: ranges from 1 to 1600, unit: 64kbps |
| Procedure | <ul style="list-style-type: none"> Enter config view. Run: bandwidth bandwidth Enter |
| Example | <pre>switch_config# policy-map 1 switch-classify# bandwidth 10 switch-classify#</pre> |

b) Drop the data packet

| | |
|-------------------------------|----------------------|
| Command | drop |
| Parameter Descriptions | Null |

c) Exit to enable mode

| | |
|-------------------------------|---------------------|
| Command | end |
| Parameter Descriptions | Null |

- Apply the traffic policy to interfaces

| | |
|-------------------------------|--|
| Command | End qos policy policy name ingress |
| Parameter Descriptions | <ul style="list-style-type: none"> policy name: the policy name that already created |
| Procedure | <ul style="list-style-type: none"> Exit and enter interface view Run: Interface gigaetherent 0/port number Enter <ul style="list-style-type: none"> Run: qos policy policy name ingress |

| | |
|----------------|---|
| | Enter |
| Example | <pre>switch_config# interface gigaEthernet 0/4 switch_config_g0/4# qos policy 2 ingress switch_config_g0/4#</pre> |

4.15 PoE Configuration

PoE configuration functionality on switches allows administrators to manage and customize the power delivery settings for PoE-enabled ports. This feature provides granular control over power allocation to connected devices, ensuring efficient utilization of PoE resources.

4.15.1 Configure PoE Maximum Power

| | |
|-------------------------------|---|
| Command | <code>poe max-power POWERLEVEL</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> POWERLEVEL: <1-390> -- Max power |
| Procedure | <ul style="list-style-type: none"> Enter config view. Run: <code>poe max-power POWERLEVEL</code> Enter |
| Example | <pre>switch_config# poe max-power 100 switch_config#</pre> |

4.15.2 Enable/Disable PoE

| | |
|-------------------------------|---|
| Command | <code>poe enable</code> |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> Enter interface view. Run: <code>poe enable</code> Enter. |
| Example | <pre>switch_config# interface gigaetherent 0/24 switch_config_g0/24# poe enable switch_config_g0/24#</pre> |

4.15.3 Configuring PoE Port Power

| | |
|-------------------------------|--|
| Command | <code>poe power portpower</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> Portpower:(0~30) 0-30w |
| Procedure | <ul style="list-style-type: none"> Enter interface view. Run: <code>poe power portpower</code> Enter. |
| Example | <pre>switch_config# interface gigaetherent 0/24 switch_config_g0/24# poe power 20 switch_config_g0/24#</pre> |

4.15.4 Configuring PoE Port Priority

| | |
|-------------------------------|---|
| Command | poe priority PRIORITY |
| Parameter Descriptions | <ul style="list-style-type: none">PRIORITY: low /middle/high |
| Procedure | <ul style="list-style-type: none">Enter interface view. Run: poe priority PRIORITY Enter. |
| Example | switch_config# interface giga ethernet 0/24 switch_config_g0/24# poe priority low switch_config_g0/24# |

4.15.5 Configuring PoE Power Reserved

| | |
|-------------------------------|--|
| Command | poe power-reserved reserved-rate |
| Parameter Descriptions | <ul style="list-style-type: none">reserved-rate: 0-100 |
| Procedure | <ul style="list-style-type: none">Enter interface view. Run: poe power-reserved reserved-rate Enter. |
| Example | switch_config# poe power-reserved reserved-rate |

4.15.6 Configuring PoE Power Overload

| | |
|-------------------------------|---|
| Command | poe power-overload poe_overload |
| Parameter Descriptions | <ul style="list-style-type: none">poe_watchdog:1-10 |
| Procedure | <ul style="list-style-type: none">Enter interface view. Run: poe poe-overload poe_overload Enter. |
| Example | switch_config# poe poe-overload 1 |

5 IP Services Configuration

Following with the introductions of IP services configuration, including the basic knowledge and configurations of IP addresses (including basic IPv6 functions), DHCP, ARP, and DNS.

5.1 IP Address Configuration

The Internet Protocol (IP) is the core protocol in the TCP/IP protocol suite. Data of TCP, UDP, ICMP and IGMP protocols is transmitted in IP packets. Devices on different network segments communicate with each other using network-layer address, that is, IP addresses.

An IP address is a 32-bit address used on the Internet. Each host on an IP network must have an IP address.

An IP address consists of a network ID and a host ID. The network ID identifies a network and the host ID identifies a specific network device on the network. Network devices with the same network ID are located on the same network, regardless of their physical locations.

The device supports to configure the IP address of vlanIF for the device, including IPv4 and IPv6.

- Query VLAN interface number

| | |
|-------------------------------|---|
| Command | show vlan |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none">· Enter config view <p>Run: show vlan</p> <p>Enter</p> |
| Example | Switch_config# show vlan VLAN Status Name Ports ----- 1 Static Default G0/5 , G0/6 , G0/7 , G0/8 G0/9 , G0/10, G0/11, G0/12 G0/13, G0/14, G0/15, G0/16 G0/17, G0/18, G0/19, G0/20 G0/21, G0/22, G0/23, T0/1 T0/2 , T0/3 , T0/4 2 Static Default G0/1 , G0/3 , G0/4 3 Static Default G0/2 12 Static Default G0/24 Switch_config# |

- Configuring IPv4

| | |
|-------------------------------|---|
| Command | IP address IP address subnet mask |
| Parameter Descriptions | <ul style="list-style-type: none">· <u>IP address</u> : IP address of the unicast· <u>subnet mask</u>: subnet mask of the IP address |
| Procedure | <ul style="list-style-type: none">· Enter config view.· Run: Interface vlan vlan interface numberEnter· Run: IP address IP address subnet mask |

| | |
|-------------------------------|---|
| | Enter |
| Example | <pre>switch_config# interface vlan 2 switch_config_v2# IP address 192.168.2.1 255.255.255.0 switch_config_v2#</pre> |
| · Configuring IPv6 | |
| Command | ipv6 address IPv6 global address |
| Parameter Descriptions | <u>IPv6 global address</u> : ipv6 address, in the form of: X:X:X:X::X/<0-128> |
| Procedure | <ul style="list-style-type: none"> · Enter config view. · Run: Interface vlan vlan interface number Enter · Run: Ipv6 address IPv6 address subnet mask Enter |
| Example | <pre>switch_config# interface vlan 6 Switch_config_v6# ipv6 address 2000::1111/64 Switch_config_v6#</pre> |

5.2 DHCP Configuration

Dynamic Host Configuration Protocol (DHCP) dynamically manages and configures clients in a centralized manner. DHCP uses the client/server model. A client applies to the server for configurations such as the IP address, subnet mask, and default gateway; the server replies with requested configurations based on policies.

As the network expands and becomes complex, the number of hosts often exceeds the number of available IP addresses. As portable computers and wireless networks are widely used, the positions of computers often change, causing IP addresses of the computers to be changed accordingly. As a result, network configurations become increasingly complex. To properly and dynamically assign IP addresses to hosts, DHCP is used.

DHCP rapidly and dynamically allocates IP addresses, which improves IP address usage.

The device supports to enable/disable the DHCP snooping function and configure a DHCP server based on the address pool.

The function is off by default.

5.2.1 Enable/Disable DHCP Server

| | |
|-------------------------------|--|
| Command | (no) ip dhcp server |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: (no) ip dhcp server Enter. |
| Example | <pre>switch_config# ip dhcp server switch_config# no ip dhcp server switch_config#</pre> |

5.2.2 IPv4 DHCP Snooping

DHCP (Dynamic Host Configuration Protocol) snooping is a security feature that enhances network integrity by preventing rogue DHCP server attacks and unauthorized IP address assignments. It monitors DHCP messages and ensures only authorized DHCP servers are allowed to assign IP addresses.

- Configuring Trust Mode

| | |
|-------------------------------|---|
| Command | <code>ip dhcp snooping trust</code> |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter interface view. Run: <code>ip dhcp snooping trust</code> Enter. |
| Example | <code>switch_config_g0/21# ip dhcp snooping trust</code> <code>switch_config_g0/21#</code> |

- Configuring no trust mode

| | |
|-------------------------------|--|
| Command | <code>no ip dhcp snooping trust</code> |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter interface view. Run: <code>no ip dhcp snooping trust</code> Enter. |
| Example | <code>switch_config_g0/21# no ip dhcp snooping trust</code> <code>switch_config_g0/21#</code> |

5.2.3 IPv6 DHCP Snooping

DHCPv6 (Dynamic Host Configuration Protocol for IPv6) snooping is a security feature that enhances network reliability by preventing unauthorized IPv6 address assignments and mitigating potential rogue DHCPv6 server attacks. It monitors DHCPv6 messages to ensure valid address assignments and protect against malicious activities.

- Turn On/off IPv6 DHCP Snooping

| | |
|-------------------------------|--|
| Command | <code>(no) ipv6 dhcp snooping</code> |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: <code>(no) ipv6 dhcp snooping</code> Enter. |
| Example | <code>switch_config# ipv6 dhcp snooping</code> <code>switch_config# no ipv6 dhcp snooping</code> <code>switch_config#</code> |

5.3 DHCP Relay

DHCP (Dynamic Host Configuration Protocol) relay is a feature that allows switches to forward DHCP messages between clients and servers across different network segments. It enables DHCP

requests from clients in one subnet to reach DHCP servers in another subnet, facilitating centralized IP address management.

5.3.1 Enable DHCP Relay

| | |
|-------------------------------|---|
| Command | ip forward-protocol udp bootps |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> Enter config view. Run: ip forward-protocol udp bootps Enter. |
| Example | switch_config# ip forward-protocol udp bootps |

5.4 ARP Configuration

As the basis of Ethernet network communication, ARP maps IP addresses to MAC addresses.

On a local area network (LAN), a host or a network device must learn the IP address of the destination host or device before sending data to it. Additionally, the host or network device must learn the physical address of the destination host or device because IP packets must be encapsulated into frames for transmission over a physical network. Therefore, the mapping from an IP address into a physical address is required. ARP is used to map IP addresses into physical addresses.

The device supports configuring the dynamic ARP aging time, creating and delete static ARP.

| | |
|-------------------------------|--|
| Command | arp A.B.C.D HH:HH:HH:HH:HH:HH |
| Parameter Descriptions | <ul style="list-style-type: none"> A.B.C.D -- IP address HH:HH:HH:HH:HH:HH -- 48 bit hardware address of ARP entry |
| Procedure | <ul style="list-style-type: none"> Enter config view. Run: arp A.B.C.D HH:HH:HH:HH:HH:HH Enter. |
| Example | switch_config# arp 192.168.0.253 00:00:00:22:22:22 switch_config# |

- Checking the configuration.

| | |
|----------------|--|
| Command | show arp |
| Example | <pre>switch_config# show arp VLAN ID Port ID IP address MAC Address Type ===== 1(vlan1)ARP 0/3 192.168.1.100 4c-ed-fb-61-4a-e6 ARP Static</pre> |

- Delete the ARP

| | |
|-------------------------------|--|
| Command | no arp IP address |
| Parameter Descriptions | <ul style="list-style-type: none"> <u>IP address</u> : IP address, IP address of the unicast |
| Procedure | <ul style="list-style-type: none"> Enter config view. Run: no arp IP address |

| | |
|-------------------------------|---|
| | Enter |
| Example | switch_config# no arp 192.168.1.100 switch_config# |
| · Checking the configuration. | |
| Command | show arp |
| Example | switch_config# show arp VLAN ID Port ID IP address MAC Address Type ===== |

5.5 DNS Configuration

DNS is a distributed database used in TCP and IP applications and completes resolution between IP addresses and domain names.

Each host on the network is identified by an IP address. To access a host, a user must obtain the host IP address first. It is difficult for users to remember IP addresses of hosts. Therefore, host names in the format of strings are designed. Each host name maps an IP address. In this way, users can use the simple and meaningful domain names instead of the complicated IP addresses to access hosts.

The switch supports to function as a DNS client and supports static and dynamic domain name resolution.

| | |
|-------------------------------|--|
| Command | ip dns server A.B.C.D |
| Parameter Descriptions | · A.B.C.D -- Domain name server's IP address |
| Procedure | · Enter config view. Run: ip dns server A.B.C.D Enter. |
| Example | switch_config# ip dns server 192.168.1.34 switch_config# |

- Checking the configuration.

| | |
|----------------|--|
| Command | show running-config |
| Example | Switch_config# show running-config Building configuration. Current Configuration: !version 1.1.3c_M28P_B4M_T0 ! hostname ! username admin password 0 admin ! no spanning-tree ! IP dns server 192.168.2.5 -More- |

5.6 IP ACL

ACL (Access Control List) configuration enables users to define rules that filter and control network traffic based on criteria like source/destination IP addresses, ports, and protocols. ACLs help enforce security policies by permitting or denying specific types of traffic, such as allowing access to certain services

while blocking unauthorized traffic. By configuring ACLs, users can enhance network security, manage bandwidth usage, and control access to resources. It is essential to understand ACL syntax and guidelines to effectively implement and maintain a secure and efficient network environment. IP ACL and IP Extended ACL are parts of ACL feature.

5.6.1 Create Standard IP ACL

Beginning in config view, follow these steps to create an IP standard ACL for IP traffic:

| | |
|-------------------------------|---|
| Command | <code>ip access-list standard ACL</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> · ACL: WORD -- IP access-list name |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: <code>ip access-list standard ACL</code> Enter. |
| Example | <code>switch_config# ip access-list standard acl1 switch_config_std_acl#</code> |

5.6.2 Apply IP ACL to Port

This operation effect in direction by default.

| | |
|-------------------------------|--|
| Command | <code>ip access_group ACL</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> · ACL: WORD -- IP access-list name |
| Procedure | <ul style="list-style-type: none"> · Enter interface view. Run: <code>ip access_group ACL</code> Enter. |
| Example | <code>switch_config_g0/8# ip access_group acl1 switch_config_g0/8#</code> |

5.6.3 Apply IP access-group ACL to Policy

| | |
|-------------------------------|--|
| Command | <code>classify ip access-group ACL</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> · ACL:WORD -- Access list name |
| Procedure | <ul style="list-style-type: none"> · Enter policy_map view. Run: <code>classify ip access-group ACL</code> Enter. |
| Example | <code>switch_policy_map# classify ip access-group acl1 switch-classify#</code> |

5.6.4 Configuring Permit Operation

| | |
|-------------------------------|--|
| Command | <code>permit host ADD /any netmask</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> · ADD: A.B.C.D -- Address to match · netmask :A.B.C.D -- IP subnet mask |

| | |
|------------------|--|
| Procedure | <ul style="list-style-type: none"> Enter std_nacl view. Run: permit host SOUR /any netmask Enter. |
| Example | switch_config_std_nacl# permit 192.168.3.123 255.255.25.0 switch_config_std_nacl# |

5.6.5 Configuring Deny Operation

| | |
|-------------------------------|--|
| Command | permit host ADD /any netmask |
| Parameter Descriptions | <ul style="list-style-type: none"> ADD: A.B.C.D -- Address to match netmask :A.B.C.D -- IP subnet mask |
| Procedure | <ul style="list-style-type: none"> Enter std_nacl view. Run: deny host SOUR /any netmask Enter. |
| Example | switch_config_std_nacl# deny 192.168.3.123 255.255.25.0 switch_config_std_nacl# |

5.7 Extended IP ACL

Beginning in config view, follow these steps to create an IP extended ACL for IP traffic

5.7.1 Extend ACL

| | |
|-------------------------------|--|
| Command | ip access-list extended ACL |
| Parameter Descriptions | <ul style="list-style-type: none"> ACL:WORD -- Extended Access-list name |
| Procedure | <ul style="list-style-type: none"> Enter config view. Run: ip access-list extended ACL Enter. |
| Example | switch_config# ip access-list extended 7 switch_config_ext_nacl# |

5.8 Policy Configuration

A policy map allows for traffic prioritization, QoS implementation, and bandwidth allocation based on specific criteria like IP addresses, protocols, or port numbers. It enables congestion control, traffic shaping, and security enforcement, optimizing network performance. By defining rules and actions, policy maps ensure that critical applications receive necessary resources while preventing non-essential traffic from consuming excessive bandwidth. This leads to efficient resource utilization, reduced latency for time-sensitive applications, and overall network stability. Policy maps also facilitate compliance with network policies and regulatory requirements, contributing to a well-managed and reliable network infrastructure.

5.8.1 Configuring Policy

| | |
|-------------------------------|---|
| Command | permit host HH:HH:HH:HH:HH:HH destination |
| Parameter Descriptions | <ul style="list-style-type: none"> HH:HH:HH:HH:HH:HH -- Source mac address |

| | |
|------------------|---|
| | <ul style="list-style-type: none"> • Destination: any -- Any destination MAC address • host -- A single destination host |
| Procedure | <ul style="list-style-type: none"> • Enter mac1 view. Run: permit host HH:HH:HH:HH:HH:HH destination Enter. |
| Example | <pre>switch_config# mac access-list acl1 switch_config_macl# permit host 00:00:00:11:11:11 any switch_config_macl# permit host 00:00:00:11:11:11 host switch_config_macl#</pre> |

5.8.2 Create policy map

| | |
|-------------------------------|--|
| Command | <code>policy-map WORD</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> • WORD -- Policy-map name |
| Procedure | <ul style="list-style-type: none"> • Enter config view. Run: policy-map WORD Enter. |
| Example | <pre>switch_config# policy-map pol1 switch_policy_map#</pre> |

5.8.3 Create Classify MAC Access Group

| | |
|-------------------------------|---|
| Command | <code>classify mac access-group WORD</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> • WORD -- Access list name |
| Procedure | <ul style="list-style-type: none"> • Enter policy_map view. Run: classify mac access-group WORD Enter. |
| Example | <pre>switch_policy_map# classify mac access-group 2 switch-classify#</pre> |

5.8.4 Configuring Bandwidth Limit

| | |
|-------------------------------|---|
| Command | <code>bandwidth BW</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> • BW :1-1600 -- Configure Bandwidth(unit:64kbps) |
| Procedure | <ul style="list-style-type: none"> • Enter classify view. Run: bandwidth BW Enter. |
| Example | <pre>switch-classify# bandwidth 1</pre> |

5.8.5 Configuring COS

| | |
|-------------------------------|--|
| Command | <ul style="list-style-type: none"> · set cos COS |
| Parameter Descriptions | <ul style="list-style-type: none"> · COS:<0-7> -- Config cos value |
| Procedure | <ul style="list-style-type: none"> · Enter classify view. Run: set cos COS Enter. |
| Example | switch-classify# set cos 5 |

5.8.6 Delete Classify

| | |
|-------------------------------|---|
| Command | drop |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter classify view. Run: drop Enter. |
| Example | switch-classify# drop switch-classify# |

5.8.7 Configuring DSCP

| | |
|-------------------------------|---|
| Command | set dscp DSCP |
| Parameter Descriptions | <ul style="list-style-type: none"> · DSCP :<0-63> -- Config dscp value |
| Procedure | <ul style="list-style-type: none"> · Enter interface view. Run: set dscp DSCP Enter. |
| Example | switch-classify# set dscp 63 switch-classify# |

5.8.8 Configuring VLANID

| | |
|-------------------------------|--|
| Command | <ul style="list-style-type: none"> · set vlanID ID |
| Parameter Descriptions | <ul style="list-style-type: none"> · ID:<1-4049> -- Config vlanid value |
| Procedure | <ul style="list-style-type: none"> · Enter classify view. Run: set vlanID ID Enter. |
| Example | switch-classify# set vlanID 10 |

5.8.9 Configuring Policy Map

| | |
|----------------|-------------------------------------|
| Command | qos policy NAME MAP |
|----------------|-------------------------------------|

| | |
|-------------------------------|--|
| Parameter Descriptions | <ul style="list-style-type: none"> · NAME:WORD -- policy-map name · MAP: · ingress -- Config port policy map ingress · egress -- Config port policy map egress |
| Procedure | <ul style="list-style-type: none"> · Enter interface view. Run: qos policy NAME MAP Enter. |
| Example | <pre>switch_config_g0/1# qos policy 1 ingress switch_config_g0/1#</pre> |

6 IP Multicast Configuration

6.1 IGMP Snooping Configuration Based On VLAN

Internet Group Management Protocol Snooping (IGMP Snooping) maintains information about the outgoing interfaces of multicast packets by snooping multicast protocol packets exchanged between the Layer 3 multicast device and user hosts. The IGMP Snooping protocol manages and controls the forwarding of multicast packets at the data link layer.

The device supports to enable/disable the function, and configure IGMP Snooping timer.

- Enable the IGMP Snooping function

| | |
|-------------------------------|--|
| Command | IP IGMP Snooping |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none">· Enter config view. Run: IP IGMP Snooping Enter |
| Example | switch_config# IP IGMP Snooping switch_config# |

- Disable the IGMP Snooping function

| | |
|-------------------------------|---|
| Command | no IP IGMP Snooping |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none">· Enter config view. Run: no IP IGMP Snooping Enter |
| Example | switch_config# no IP IGMP Snooping switch_config# |

- Enable the IGMP Snooping querier function

| | |
|-------------------------------|---|
| Command | IP IGMP Snooping querier |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none">· Enter config view. Run: IGMP Snooping querier Enter |
| Example | switch_config# IP IGMP Snooping querier switch_config# |

- Configuring query interval time

| | |
|-------------------------------|--|
| Command | IP IGMP Snooping timer querier interval time |
| Parameter Descriptions | <ul style="list-style-type: none">· <u>interval time</u>: Interval time ranges from 60~1000 in seconds |
| Procedure | <ul style="list-style-type: none">· Enter config view. |

| | |
|----------------|--|
| | Run: IP IGMP Snooping timer querier interval time Enter |
| Example | switch_config# IP IGMP Snooping timer querier 60 switch_config# |

- Configuring group members survival time

| | |
|-------------------------------|--|
| Command | IP IGMP Snooping timer survival time |
| Parameter Descriptions | <ul style="list-style-type: none"> · <u>survival time</u>: Survival time ranges from 120~5000 in seconds. |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: IP IGMP Snooping timer survival time Enter |
| Example | switch_config# IP IGMP Snooping timer survival 120 switch_config# |

- **Configuring Global Route Port**

| | |
|-------------------------------|--|
| Command | ip igmp-snooping route-port PORTRANGE |
| Parameter Descriptions | <ul style="list-style-type: none"> · PORTRANGE: <x-x> -- Config port range |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: ip igmp-snooping route-port PORTRANGE Enter. |
| Example | switch_config# ip igmp-snooping route-port 1-3 switch_config# |

- Configuring IGMP Snooping Fast Leave

| | |
|-------------------------------|--|
| Command | ip igmp-snooping fast-leave |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: ip igmp-snooping fast-leave Enter. |
| Example | switch_config# ip igmp-snooping fast-leave switch_config# |

- Checking the configuration

| | |
|----------------|---|
| Command | show ip IGMP Snooping |
| Example | switch_config# show ip IGMP Snooping Global IGMP snooping configuration: ----- Globally enable : Enabled Querier : Enabled Querier time : 640 |

| | |
|-------------------------------|--|
| | Member age time : 2000 switch_config# |
| · Static Multicast Table | |
| Command | <code>mac address-table static MAC vlan VLANID interface gigaEthernet PORT</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> · MAC: HH:HH:HH:HH:HH:HH -- 48 bit mac address · VLANID: <1-4094> -- VLAN id of mac address table · PORT: <0-0> -- FastEthernet interface number |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: <code>mac address-table static MAC vlan VLANID interface gigaEthernet PORT</code> Enter. |
| Example | <code>switch_config# mac address-table static 01:00:5e:c4:c2:f0 vlan 2 interface gigaEthernet 0/5 switch_config#</code> |

7 Security Configuration

7.1 MAC Table Configuration

A MAC address table records the MAC address, interface number, and VLAN ID of the device connected to the device.

Each device maintains a MAC address table. A MAC address table records the MAC address, interface number, and VLAN ID of the connected devices. When forwarding a data frame, the device searches the MAC table for the outbound interface according to the destination MAC address in the frame. This helps the device reduce broadcasting.

Categories of MAC Address Entries

The MAC address entry can be classified into the dynamic entry, the static entry and the blackhole entry.

The dynamic entry is created by learning the source MAC address. It has aging time.

The static entry is set by users and is delivered to each SIC. It does not age.

The blackhole entry is used to discard the frame with the specified source MAC address or destination MAC address. Users manually set the blackhole entries and send them to each SIC. Blackhole entries have no aging time.

The dynamic entry will be lost after the system is reset or the interface board is hot swapped or reset. The static entry and the blackhole entry, however, will not be lost.

The device supports configuring:

- Aging time of MAC table
- Static MAC table
- Query MAC table

7.1.1 Configuring Aging Time of MAC Table

Using the command line, users can change the aging time of MAC table.

The default value is 300s.

| | |
|-------------------------------|---|
| Command | mac address-table aging-time aging time |
| Parameter Descriptions | <ul style="list-style-type: none">· <u>aging time</u>: Aging time in seconds, ranges from 10-1000000. |
| Procedure | <ul style="list-style-type: none">· Enter config view. Run: mac address-table aging-time aging time Enter |
| Example | switch_config# mac address-table aging-time 1000 switch_config# |

- Checking the configuration.

| | |
|----------------|---|
| Command | show running-config |
| Example | Switch_config# show running-config Building configuration. Current Configuration: !version 1.1.3c_M28P_B4M_T0 ! hostname ! username admin password 0 admin ! no spanning-tree ! |

| | | |
|--|---|---|
| | spanning-tree rstp priority 4096 IP IGMP Snooping IP IGMP Snooping querier mac address-table aging-time 1000 --More-- | ! |
|--|---|---|

7.1.2 Configuring Static MAC Table

Using the command lines, users can add and delete the MAC table.

No default value.

- Add the MAC table

| | | | | | |
|-------------------------------|---|--------------|---------------------------|-----------------|------------------------------|
| Command | <u>mac address-table static HH:HH:HH:HH:HH:HH vlan vlan id interface interface type interface number</u> | | | | |
| Parameter Descriptions | <ul style="list-style-type: none"> · <u>HH:HH:HH:HH:HH:HH</u>: 48 bit mac address · <u>Vlan id</u>: VLAN id of mac address table, the value ranges from 1 to 4094. · <u>interface type</u> : interface type, including <table style="margin-left: 20px;"> <tr> <td>GigaEthernet</td> <td>-- GigaEthernet interface</td> </tr> <tr> <td>TenGigaEthernet</td> <td>-- TenGigaEthernet interface</td> </tr> </table> · <u>interface number</u>: interface number, in the format as “0/port number”, the value of port number value is the port number of the switch. | GigaEthernet | -- GigaEthernet interface | TenGigaEthernet | -- TenGigaEthernet interface |
| GigaEthernet | -- GigaEthernet interface | | | | |
| TenGigaEthernet | -- TenGigaEthernet interface | | | | |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: <u>mac address-table static HH:HH:HH:HH:HH:HH vlan vlan id interface interface type interface number</u> Enter | | | | |
| Example | <pre>switch_config# mac address-table static 00:00:00:00:00:06 vlan 1 interface gigaEthernet 0/24 switch_config#</pre> | | | | |

- Checking the configuration.

| | |
|----------------|--|
| Command | <u>show mac address-table static</u> |
| Example | <pre>Switch_config# show mac address-table static Interface VLAN ID Type MAC Address ===== g0/24 1 Static 00:00:00:00:00:06 Switch_config#</pre> |

- Delete the MAC table

| | |
|-------------------------------|--|
| Command | <u>no mac address-table static HH:HH:HH:HH:HH:HH vlan vlan id</u> |
| Parameter Descriptions | <ul style="list-style-type: none"> · <u>HH:HH:HH:HH:HH:HH</u>: 48 bit mac address · <u>Vlan id</u>: VLAN id of mac address table, the value ranges from 1 to 4094. |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: <u>no mac address-table static HH:HH:HH:HH:HH:HH vlan vlan id</u> Enter |

| Example | Switch_config# no mac address-table static 00:00:00:00:00:01 vlan 1 Switch_config# | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------------------|--|-----------|-------------------|------|-------------|------|---|--------|-------------------|------|---|--------|-------------------|------|---|--------|-------------------|-----------|---------|------|-------------|------|---|--------|-------------------|------|---|--------|-------------------|
| · Checking the configuration. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Command | no mac address-table static HH:HH:HH:HH:HH:HH <i>vlan</i> <i>vlan id</i> show mac address-table static | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Example | Switch_config# show mac address-table static <table> <thead> <tr> <th>Interface</th> <th>VLAN ID</th> <th>Type</th> <th>MAC Address</th> </tr> </thead> <tbody> <tr> <td>g0/3</td> <td>3</td> <td>Static</td> <td>00:00:00:00:00:03</td> </tr> <tr> <td>g0/2</td> <td>2</td> <td>Static</td> <td>00:00:00:00:00:02</td> </tr> <tr> <td>g0/1</td> <td>1</td> <td>Static</td> <td>00:00:00:00:00:01</td> </tr> </tbody> </table> Switch_config# no mac address-table static 00:00:00:00:00:01 vlan 1 Switch_config# show mac address-table static <table> <thead> <tr> <th>Interface</th> <th>VLAN ID</th> <th>Type</th> <th>MAC Address</th> </tr> </thead> <tbody> <tr> <td>g0/3</td> <td>3</td> <td>Static</td> <td>00:00:00:00:00:03</td> </tr> <tr> <td>g0/2</td> <td>2</td> <td>Static</td> <td>00:00:00:00:00:02</td> </tr> </tbody> </table> | Interface | VLAN ID | Type | MAC Address | g0/3 | 3 | Static | 00:00:00:00:00:03 | g0/2 | 2 | Static | 00:00:00:00:00:02 | g0/1 | 1 | Static | 00:00:00:00:00:01 | Interface | VLAN ID | Type | MAC Address | g0/3 | 3 | Static | 00:00:00:00:00:03 | g0/2 | 2 | Static | 00:00:00:00:00:02 |
| Interface | VLAN ID | Type | MAC Address | | | | | | | | | | | | | | | | | | | | | | | | | | |
| g0/3 | 3 | Static | 00:00:00:00:00:03 | | | | | | | | | | | | | | | | | | | | | | | | | | |
| g0/2 | 2 | Static | 00:00:00:00:00:02 | | | | | | | | | | | | | | | | | | | | | | | | | | |
| g0/1 | 1 | Static | 00:00:00:00:00:01 | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Interface | VLAN ID | Type | MAC Address | | | | | | | | | | | | | | | | | | | | | | | | | | |
| g0/3 | 3 | Static | 00:00:00:00:00:03 | | | | | | | | | | | | | | | | | | | | | | | | | | |
| g0/2 | 2 | Static | 00:00:00:00:00:02 | | | | | | | | | | | | | | | | | | | | | | | | | | |

7.1.3 Query MAC Table

Using the command line, users can query the MAC table.

No default value.

- Query all the MAC table, including dynamic and static MAC table

| Command | show mac address-table | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------------------|---|---------|-------------------|-----------|---------|------|-------------|-------|---|---------|-------------------|-------|---|---------|-------------------|-------|---|---------|-------------------|-------|---|---------|-------------------|-------|---|---------|-------------------|-------|---|---------|-------------------|-------|---|---------|-------------------|-------|---|---------|-------------------|-------|---|---------|-------------------|-------|---|---------|-------------------|-------|---|---------|-------------------|-------|---|---------|-------------------|------|---|--------|-------------------|-------|---|---------|-------------------|-------|---|---------|-------------------|-------|---|---------|-------------------|
| Parameter Descriptions | Null | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

7.2 MAC Dynamic Aging

Dynamic addresses are source MAC addresses that the switch learns and then ages when they are not in use. You can change the aging time setting for all VLANs or for a specified VLAN. Setting too short aging time can cause addresses to be prematurely removed from the table. Then when the switch receives a packet for an unknown destination, it floods the packet to all ports in the same VLAN as the receiving port. This unnecessary flooding can impact performance. Setting too long an aging time can cause the address table to be filled with unused addresses, which prevents new addresses from being learned. Flooding results, which can impact switch performance.

7.2.1 Configuring mac aging time

Follow these steps to Configuring the dynamic address table aging time:

| | |
|-------------------------------|--|
| Command | mac address-table aging-time |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: <code>mac address-table aging-time</code> Enter. |
| Example | <code>switch_config# mac address-table aging-time</code> <code>switch_config#</code> |

7.3 MAC Based ACL

ACL (Access Control List) configuration enables users to define rules that filter and control network traffic based on criteria like source/destination IP addresses, ports, and protocols. ACLs help enforce security policies by permitting or denying specific types of traffic, such as allowing access to certain services while blocking unauthorized traffic. By configuring ACLs, users can enhance network security, manage bandwidth usage, and control access to resources. It is essential to understand ACL syntax and guidelines to effectively implement and maintain a secure and efficient network environment. MAC Based ACL is part of ACL feature.

7.3.1 MAC ACL

You can classify IP traffic by using IP standard or IP extended ACLs. You can classify IP and non-IP traffic by MAC ACLs.

Beginning in config view, follow these steps to create a MAC ACL:

| | |
|-------------------------------|--|
| Command | mac access-list ACL |
| Parameter Descriptions | <ul style="list-style-type: none"> · <code>ACL:WORD</code> -- IP access-list name |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: mac access-list ACL |

| | |
|----------------|---|
| | Enter. |
| Example | switch_config# mac access-list 1 switch_config_macl# |

7.3.2 Configuring Permit Operation

| | |
|-------------------------------|--|
| Command | permit host SOUR /any host DEST/any TYPE |
| Parameter Descriptions | <ul style="list-style-type: none"> SOUR :HH:HH:HH:HH:HH:HH -- Source mac address DEST :HH:HH:HH:HH:HH:HH -- Destination mac address TYPE:<1536-65535> -- An arbitrary EtherType |
| Procedure | <ul style="list-style-type: none"> Enter macl view. Run: permit host SOUR /any host DEST/any TYPE Enter. |
| Example | switch_config_macl# permit host 00:60:A7:14:78:52 host 68:A3:C4:CC:7A:F4 switch_config_macl# \$ 00:60:A7:14:78:52 host 68:A3:C4:CC:7A:F4 1536 switch_config_macl# |

7.3.3 Configuring Deny Operation

| | |
|-------------------------------|--|
| Command | deny host SOUR /any host DEST/any TYPE |
| Parameter Descriptions | <ul style="list-style-type: none"> SOUR :HH:HH:HH:HH:HH:HH -- Source mac address DEST :HH:HH:HH:HH:HH:HH -- Destination mac address TYPE:<1536-65535> -- An arbitrary EtherType |
| Procedure | <ul style="list-style-type: none"> Enter macl view. Run: deny host SOUR /any host DEST/any TYPE Enter. |
| Example | switch_config_macl# deny host 00:60:A7:14:78:52 host 68:A3:C4:CC:7A:F4 switch_config_macl# \$ 00:60:A7:14:78:52 host 68:A3:C4:CC:7A:F4 1536 switch_config_macl# config_macl# deny host/any host/any type/lenge |

7.3.4 Configuring Bandwidth Limit

| | |
|-------------------------------|---|
| Command | bandwidth host SOUR /any host DEST/any TYPE BDWIDTH |
| Parameter Descriptions | <ul style="list-style-type: none"> SOUR :HH:HH:HH:HH:HH:HH -- Source mac address DEST :HH:HH:HH:HH:HH:HH -- Destination mac address TYPE:<1536-65535> -- An arbitrary EtherType BDWIDTH :<0-1000> -- Bandwidth(n*64 Kbps) |
| Procedure | <ul style="list-style-type: none"> Enter macl view. Run: bandwidth host SOUR /any host DEST/any TYPE BDWIDTH Enter. |
| Example | switch_config_macl# bandwidth any host 68:A3:C4:CC:7A:F4 1536 100 switch_config_macl# bandwidth host 00:60:A7:14:78:52 host |

| | |
|--|--|
| | 68:A3:C4:CC:7A:F4 1536 100 switch_config_mac# |
|--|--|

7.3.5 Apply MAC ACL To Port

This operation effect in direction by default.

| | |
|-------------------------------|---|
| Command | mac access-list ACL |
| Parameter Descriptions | <ul style="list-style-type: none"> · ACL:WORD -- IP access-list name |
| Procedure | <ul style="list-style-type: none"> · Enter interface view. Run: mac access-list ACL Enter. |
| Example | switch_config# interface gigaethernet 0/24 switch_config_g0/24# mac access-list 1 switch_config_g0/24# |

7.3.6 Apply MAC Access-group ACL To Policy Map

| | |
|-------------------------------|--|
| Command | classify mac access-group ACL |
| Parameter Descriptions | <ul style="list-style-type: none"> · ACL: WORD -- Access list name |
| Procedure | <ul style="list-style-type: none"> · Enter policy_map view. Run: classify mac access-group ACL Enter. |
| Example | switch_policy_map# classify mac access-group 1 switch-classify# |

7.4 802.1x Authentication

In the network planning deployment of the access layer, users need to deploy access-side security, only legitimate users can access the network after authentication. 802.1x can be well deployed on the access switch ports to achieve access-side security control.

802.1x authentication is available as a local-based authentication method or as a radius-based remote authentication method. We go through case examples to explain 802.1x local and remote radius authentication in detail.

7.4.1 Enable Authentication Global Setting

| | |
|-------------------------------|---|
| Command | dot1x enable |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: dot1x enable Enter. |
| Example | switch_config# dot1x enable switch_config# |

7.4.2 Configuring Period re-Authentication

| | |
|-------------------------------|--|
| Command | <code>dot1x timeout re-authperiod PERIOD</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> PERIOD |
| Procedure | <ul style="list-style-type: none"> Enter config view. Run: <code>dot1x timeout re-authperiod PERIOD</code> Enter. |
| Example | <code>switch_config# dot1x timeout re-authperiod 60</code> <code>switch_config#</code> |

7.4.3 Configuring Port Authentication Method

| | |
|-------------------------------|--|
| Command | <code>dot1x authentication method Auth-method</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> Auth-method: MAC-Based -- Select 802.1x chap authenticate type Port-Based -- Select 802.1x eap authenticate type |
| Procedure | <ul style="list-style-type: none"> Enter interface view. Run: <code>dot1x authentication method Auth-method</code> Enter. |
| Example | <code>switch_config_g0/1# dot1x authentication method mac-Based</code> <code>switch_config_g0/1#</code> |

7.4.4 Configuring Port Control Mode

| | |
|-------------------------------|--|
| Command | <code>dot1x port-control MODE</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> MODE provide 3 mode: Auto -- Authenticate automatically Authorized-force -- Force port to authorized state Unauthorized-force -- Force port to unauthorized state |
| Procedure | <ul style="list-style-type: none"> Enter interface view. Run: Enter. |
| Example | <code>switch_config_g0/2# dot1x port-control auto</code> <code>switch_config_g0/2# dot1x port-control Authorized-force</code> <code>switch_config_g0/2#</code> |

7.4.5 Configuring Max User Number

| | |
|----------------|-------------------------------------|
| Command | <code>dot1x max-user USERNUM</code> |
|----------------|-------------------------------------|

| | |
|-------------------------------|--|
| Parameter Descriptions | <ul style="list-style-type: none"> · USERNUM : (1-4096) |
| Procedure | <ul style="list-style-type: none"> · Enter interface view. Run: dot1x max-user USERNUM Enter. |
| Example | switch_config_g0/2# dot1x max-user 5 switch_config_g0/2# |

7.4.6 Configuring Authentication Way

| | |
|-------------------------------|--|
| Command | <code>aaa authentication login default group radius</code> |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: aaa authentication login default group radius Enter. |
| Example | switch_config# aaa authentication login default group radius/local |

7.4.7 Enable Dot1x

| | |
|-------------------------------|---|
| Command | <code>dot1x enable</code> |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: dot1x enable Enter. |
| Example | switch_config# dot1x enable switch_config# |

7.4.8 Enable/Disable AAA

| | |
|-------------------------------|--|
| Command | <code>aaa authentication enable default enable/none</code> |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: aaa authentication enable default enable/none Enter. |
| Example | switch_config# aaa authentication enable default enable switch_config# aaa authentication enable default none switch_config# |

7.4.9 Configuring Login Authentication Method

| | |
|----------------|---|
| Command | <code>aaa authentication enable default group MODE</code> |
|----------------|---|

| | |
|-------------------------------|---|
| Parameter Descriptions | <ul style="list-style-type: none"> • MODE: <ul style="list-style-type: none"> • radius -- Use list of all Radius hosts • tacacs+ -- Use list of all Tacacs+ hosts |
| Procedure | <ul style="list-style-type: none"> • Enter config view. <p>Run: aaa authentication enable default group MODE</p> <p>Enter.</p> |
| Example | <pre>switch_config# aaa authentication enable default group radius switch_config# aaa authentication enable default group tacacs+ switch_config#</pre> |

7.4.10 Configuring Secret Level and Password

| | |
|-------------------------------|---|
| Command | <code>enable secret level LEVEL LINE1/ TYPE LINE2</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> • LEVEL :<1-15> -- Level number • LINE1 -- The UNENCRYPTED <cleartext> enable secret • TYPE: <ul style="list-style-type: none"> • 0 -- Specifies an UNENCRYPTED password will follow • 5 -- Specifies a HIDDEN password will follow • LINE2 -- The ENCRYPTED 'enable' secret string |
| Procedure | <ul style="list-style-type: none"> • Enter config view. <p>Run: enable secret level LEVEL LINE1/ TYPE LINE2</p> <p>Enter.</p> |
| Example | <pre>switch_config# enable secret level 15 0 pswd1 switch_config# enable secret level 15 pswd2 switch_config#</pre> |

7.4.11 Configuring Host/Back Server

| | |
|-------------------------------|--|
| Command | <code>radius-server ip HOST back ip BACK auth-port PORT1 acct-port PORT2</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> • HOST: ip -- Specify a RADIUS server • BACK: back -- Specify RADIUS standby server • PORT1:<0-65535> -- Port number for authentication • PORT2: <0-65535> -- Port number for account |
| Procedure | <ul style="list-style-type: none"> • Enter config view. <p>Run: radius-server host IP auth-port PORT1 acct-port PORT2</p> <p>Enter.</p> |
| Example | <pre>switch_config# radius-server host 192.168.3.10 auth-port 1812 acct-port 1813 switch_config#</pre> |

7.4.12 Configuring Server Key

| | | |
|-------------------------------|---|--|
| Command | radius-server key KEY1 | |
| Parameter Descriptions | <ul style="list-style-type: none"> · KEY1:WORD -- Key string | |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: radius-server key KEY1 Enter. | |
| Example | <pre>switch_config# radius-server key 123456 switch_config#</pre> | |

7.5 Login Filter

Login filter ACL (Access Control List) functionality allows users to define access rules for login attempts based on criteria like source IP type or protocol type. This feature enhances network security by filtering incoming login requests, allowing only authorized devices or users to access the switch for management purposes. By configuring login filter ACLs, administrators can prevent unauthorized access attempts, protect sensitive network configurations, and ensure a secure management environment. It's crucial to understand ACL syntax and guidelines to effectively implement login filter ACLs and maintain a robust network security posture.

7.5.1 Enable Port Login Security

| | | |
|-------------------------------|---|--|
| Command | switchport port-security login-filter IPTYPE PROTOCOL | |
| Parameter Descriptions | <ul style="list-style-type: none"> · IPTYPE: IPV4/IPv6 · PROTOCOL: SSH/Telnet | |
| Procedure | <ul style="list-style-type: none"> · Enter interface view. Run: switchport port-security login-filter IPTYPE PROTOCOL Enter. | |
| Example | <pre>switch_config# interface gigaethernet 0/24 switch_config_g0/24# switchport port-security login-filter IPv4 ssh switch_config_g0/24#</pre> | |

8 Reliability

8.1 STP/RSTP Configuration

The Spanning Tree Protocol (STP) trims a ring network into a loop-free tree network. It prevents replication and circular propagation of packets. The Rapid Spanning Tree Protocol (RSTP) was developed based on STP to implement faster convergence. RSTP defines edge ports and provides protection functions.

Loops often occur on a complex network. On a complex network, to implement redundancy, network designers tend to deploy multiple physical links between two devices, one of which is the master and the others are the backup.

Loops cause broadcast storms. Consequently, network resources are exhausted and the network breaks down. Loops also damage MAC addresses.

To remove loops, run STP at the data link layer. Devices running STP exchange STP BPDUs to discover loops on the network and block some ports to prune the network into a loop-free tree network. STP prevents infinite looping of packets to ensure packet processing capabilities of switches.

Because STP provides slow convergence, IEEE 802.1w released RSTP in 2001. RSTP enhances STP and speeds up network convergence.

8.1.1 STP/RSTP Global Setting

The device supports STP/RSTP functions, the functions are off by default.

- Switch the Spanning-Tree mode

| | |
|-------------------------------|---|
| Command | spanning-tree mode mode |
| Parameter Descriptions | <ul style="list-style-type: none">· Mode: Three modes: stp, setup spanning-tree protocol mode rstp, setup rapid spanning-tree protocol mode mstp, setup multiple spanning-tree protocol mode |
| Procedure | <ul style="list-style-type: none">· Enter config view. Run: spanning-tree mode mode Enter |
| Example | switch_config# spanning-tree mode stp switch_config# switch_config# spanning-tree mode rstp switch_config# |

Following will take STP mode as example to configure STP mode. Including setting priority, hello time, max age time and forward time. The relationship between protocol timer values is enforced as: $2 * (\text{forward time} - 1) \geq \text{max age time} \geq 2 * (\text{hello time} + 1)$.

The configuration steps of RSTP mode are the same.

- Set STP mode priority

| | |
|-------------------------------|---|
| Command | spanning-tree stp priority priority value |
| Parameter Descriptions | <ul style="list-style-type: none">· priority value: Rstp mode priority value, it should be one of the following values: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, 61440 |

| | The default value is 32768. | | | | | | | | | | | | | | | | | | | | |
|-------------------------------|---|------------------|--|--|--|----------|----------|------|--|--|---------|----------------|--|--|------|----------|--|--|------|------------------|--|
| Procedure | <ul style="list-style-type: none"> Run: spanning-tree stp priority priority value Enter | | | | | | | | | | | | | | | | | | | | |
| Example | <pre>Switch_config# spanning-tree stp priority 40960 Switch_config#</pre> | | | | | | | | | | | | | | | | | | | | |
| · Set STP mode Hello time | | | | | | | | | | | | | | | | | | | | | |
| Command | spanning-tree stp hello-time hello time | | | | | | | | | | | | | | | | | | | | |
| Parameter Descriptions | <ul style="list-style-type: none"> <u>hello-time</u>: STP mode hello time, the value ranges from 1s to 10s. The value is 2s by default. | | | | | | | | | | | | | | | | | | | | |
| Procedure | <ul style="list-style-type: none"> Run: spanning-tree stp hello-time hello time Enter | | | | | | | | | | | | | | | | | | | | |
| Example | <pre>Switch_config# spanning-tree stp hello-time 6 Switch_config#</pre> | | | | | | | | | | | | | | | | | | | | |
| · Set STP mode Max age time | | | | | | | | | | | | | | | | | | | | | |
| Command | spanning-tree stp max-age max-age time | | | | | | | | | | | | | | | | | | | | |
| Parameter Descriptions | <ul style="list-style-type: none"> <u>max-age time</u>: STP mode forward time, the value ranges from 4s to 30s. The value is 15s by default. | | | | | | | | | | | | | | | | | | | | |
| Procedure | <ul style="list-style-type: none"> Run: spanning-tree stp max-age max age time Enter | | | | | | | | | | | | | | | | | | | | |
| Example | <pre>Switch_config# spanning-tree stp max-age 20 Switch_config#</pre> | | | | | | | | | | | | | | | | | | | | |
| · Set STP mode forward time | | | | | | | | | | | | | | | | | | | | | |
| Command | spanning-tree stp forward-time forward time | | | | | | | | | | | | | | | | | | | | |
| Parameter Descriptions | <ul style="list-style-type: none"> <u>forward-time</u>: STP mode forward time, the value ranges from 4s to 30s. The value is 15s by default. | | | | | | | | | | | | | | | | | | | | |
| Procedure | <ul style="list-style-type: none"> Run: spanning-tree stp forward-time forward time Enter | | | | | | | | | | | | | | | | | | | | |
| Example | <pre>Switch_config# spanning-tree stp forward-time 12 Switch_config#</pre> | | | | | | | | | | | | | | | | | | | | |
| · Checking the configuration. | | | | | | | | | | | | | | | | | | | | | |
| Command | show spanning-tree | | | | | | | | | | | | | | | | | | | | |
| Example | <p>Spanning tree enabled protocol STP</p> <table> <thead> <tr> <th colspan="4">STP</th> </tr> </thead> <tbody> <tr> <td>Root Id:</td> <td>Priority</td> <td>8193</td> <td></td> </tr> <tr> <td></td> <td>Address</td> <td>0025.84d5.c700</td> <td></td> </tr> <tr> <td></td> <td>Cost</td> <td>20000000</td> <td></td> </tr> <tr> <td></td> <td>Port</td> <td>GigaEthernet0/23</td> <td></td> </tr> </tbody> </table> | STP | | | | Root Id: | Priority | 8193 | | | Address | 0025.84d5.c700 | | | Cost | 20000000 | | | Port | GigaEthernet0/23 | |

| | Switch_config# | | |

- Turning Off Spanning-Tree

| | |
|-------------------------------|---|
| Function | After configuring the spanning-tree mode, users can turn it off by using the command line. The spanning-tree function is off by default. |
| Command | no spanning-tree |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> Enter config view. Run: no spanning-tree Enter |
| Example | switch_config# no spanning-tree switch_config# |
| | • Checking the configuration. |
| Command | show spanning-tree |
| Example | Switch_config# show spanning-tree No spanning tree instances exist |

8.1.2 STP/RSTP Port Setting

Following will enter the interface view to configure ports mode of Spanning-tree.

- Configuring spanning-tree port-priority

| | |
|-------------------------------|--|
| Command | spanning-tree port-priority port priority |
| Parameter Descriptions | <ul style="list-style-type: none"> <u>port priority</u>: The value ranges from 0 to 255. Port Priority in increments of 16 is required |
| Procedure | <ul style="list-style-type: none"> Enter interface view. Run: Interface gigaEthernet 0/1 Enter Run: spanning-tree port-priority port priority Enter |
| Example | Switch_config# interface gigaEthernet 0/1 Switch_config_g0/1# spanning-tree port-priority 160 Switch_config_g0/1# |

- Configuring spanning-tree cost

| | |
|-------------------------------|---|
| Command | spanning-tree cost port path cost |
| Parameter Descriptions | port path cost: port path cost, the value ranges from 0 to 200000000. |
| Procedure | <ul style="list-style-type: none"> Run: spanning-tree cost number Enter |
| Example | Switch_config_g0/1# spanning-tree cost 100 Switch_config_g0/1# |

- Configuring spanning-tree link type

| | |
|-------------------------------|---|
| Command | spanning-tree link-type link-type |
| Parameter Descriptions | <ul style="list-style-type: none"> link-type: including two types: <ol style="list-style-type: none"> point to point shared |
| Procedure | <ul style="list-style-type: none"> Run: spanning-tree link-type link-type Enter |
| Example | Switch_config_g0/1# spanning-tree link-type point-to-point Switch_config_g0/1# |

- Set the port as edge port

| | |
|-------------------------------|--|
| Command | spanning-tree portfast |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> Run: spanning-tree portfast Enter |
| Example | Switch_config_g0/1# spanning-tree portfast Switch_config_g0/1# |

- Change an interface's spanning tree guard mode

| | |
|-------------------------------|---|
| Command | spanning-tree guard mode |
| Parameter Descriptions | <ul style="list-style-type: none"> mode: including two modes: <ol style="list-style-type: none"> none -- Set guard mode to none root -- Set guard mode to root guard on interface |
| Procedure | <ul style="list-style-type: none"> Run: spanning-tree guard mode Enter |
| Example | Switch_config_g0/1# spanning-tree guard root Switch_config_g0/1# |

- Enable BPDU filtering for this interface

| | |
|------------------|---|
| Command | spanning-tree bpdufilter enable |
| Parameter | Null |

| | |
|--|--|
| Descriptions | |
| Procedure | <ul style="list-style-type: none"> . Run: spanning-tree bpdufilter enable <p>Enter</p> |
| Example | <pre>Switch_config_g0/1# spanning-tree bpdufilter enable Switch_config_g0/1#</pre> |
| <ul style="list-style-type: none"> . Disable BPDU filtering for this interface. | |
| Command | spanning-tree bpdufilter disable |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> . Run: spanning-tree bpdufilter disable <p>Enter</p> |
| Example | <pre>Switch_config_g0/1# spanning-tree bpdufilter disable Switch_config_g0/1#</pre> |
| <ul style="list-style-type: none"> . Enable BPDU guard for this interface | |
| Command | spanning-tree bpduguard enable |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> . Run: spanning-tree bpduguard enable <p>Enter</p> |
| Example | <pre>Switch_config_g0/1# spanning-tree bpduguard enable Switch_config_g0/1#</pre> |
| <ul style="list-style-type: none"> . Disable BPDU guard for this interface | |
| Command | spanning-tree bpduguard disable |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> . Run: spanning-tree bpduguard disable <p>Enter</p> |
| Example | <pre>Switch_config_g0/1# spanning-tree bpduguard disable Switch_config_g0/1#</pre> |
| <ul style="list-style-type: none"> . Checking the configuration. | |
| Command | show running-config |
| Example | <pre>Switch_config# show running-config Building configuration. Current Configuration: !version 1.1.3c_M28P_B4M_T0 hostname username admin password 0 admin no spanning-tree no snmp-server view</pre> |

| | | |
|--|---|---|
| | interface GigaEthernet 0/1 spanning-tree cost 100 spanning-tree port-priority 160 spanning-tree link-type point-to-point spanning-tree portfast spanning-tree bpduguard enable spanning-tree bpdufilter enable spanning-tree guard root !--More-- | ! |
|--|---|---|

8.2 Fast Ring

8.2.1 Enable global Fast Ring

| | |
|-------------------------------|---|
| Command | <code>ring RINGID mode MODE</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> · RINGID : <0-255> -- Config RING id · MODE: single/double/coupling · single -- Config RING single mode · double -- Config RING double mode · coupling -- Config RING coupling mode |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: <code>ring RINGID mode MODE</code> Enter. |
| Example | <code>switch_config# ring 20 mode single</code> <code>switch_config#</code> |

8.2.2 Add Port into ring

| | |
|-------------------------------|---|
| Command | <code>switchport ring RINGID</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> · RINGID :<0-65536> -- RING id |
| Procedure | <ul style="list-style-type: none"> · Enter interface view. Run: <code>switchport ring RINGID</code> Enter. |
| Example | <code>switch_config# interface gigaethernet 0/24</code> <code>switch_config_g0/24# switchport ring 300</code> <code>switch_config_g0/24#</code> |

8.3 ERPS Ring

Ethernet Ring Protection Switching (ERPS) is defined in ITU-T G.8032 Recommendation. It prevents logical loops on a ring network by blocking redundant links.

ERPSv1 supports only the single-ring topology. When there is no faulty link on a ring network, ERPS can eliminate loops on the network. When a link fails on the ring network, ERPS can immediately restore the communication between the nodes on the network. Compared with other ring network protocols, ERPS has the following advantages:

- The network converges fast.
- ERPS is a standard protocol published by the ITU-T; therefore devices from different vendors can communicate with each other when they run ERPS.

ERPS works for ERPS rings. An ERPS ring consists of interconnected Layer 2 switching devices configured with the same control VLAN and data VLAN. Logically, an ERPS ring is a necessity before you configure other related functions.

8.3.1 Enable Global ERPs

| | |
|-------------------------------|--|
| Command | <code>erps</code> |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> • Enter config view. Run: <code>erps</code> Enter. |
| Example | <pre>switch_config# erps Enable ERPS successfully switch_config#</pre> |

8.3.2 Create ERPs Ring and Interface

| | |
|-------------------------------|---|
| Command | <code>erps ring RING-id east-interface east-interface west-interface west-interface</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> • RING-id: <1-32> -- Config RING id • east-interface: <1-28> -- Config ERPS RING PORT • west-interface: <1-28> -- Config ERPS RING PORT |
| Procedure | <ul style="list-style-type: none"> • Enter config view. Run: <code>erps ring RING-id east-interface east-interface west-interface west-interface</code> Enter. |
| Example | <pre>switch_config# erps ring 1 east-interface 1 west-interface 2 switch_config#</pre> |

8.3.3 Enter MST View

| | |
|-------------------------------|---|
| Command | <code>spanning-tree mst configuration</code> |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> • Enter config view. Run: <code>spanning-tree mst configuration</code> Enter. |
| Example | <pre>switch_config# spanning-tree mst configuration switch_config_mst#</pre> |

8.3.4 Configuring MST instance

| | |
|-------------------------------|---|
| Command | Instance VLAN vlan vlanIDs |
| Parameter Descriptions | <ul style="list-style-type: none"> • VLAN -- Range of vlans to add to the instance mapping • vlanIDs <1-4094> -- VLAN IDs(1-4094), such as(1,3,5,7) or (1,3-5,7) or (1-7) |
| Procedure | <ul style="list-style-type: none"> • Enter mst view. <p>Run: instance VLAN vlan vlanIDs</p> <p>Enter.</p> |
| Example | <pre>switch_config# spanning-tree mst configuration switch_config_mst# instance 1 vlan 3</pre> |

8.4 Loopback Protect Configuration

Loopback detection sends loopback detection packets periodically to detect loops on the network connected to the device.

When a loop occurs on a network, broadcast, multicast, and unknown unicast packets are repeatedly transmitted on the network. This wastes network resources or even causes service interruption on the entire network. To protect the network, certain actions should be taken on the interface where the loop occurs, and the administrator needs to check the network connection and configuration to solve the problem soon. Therefore, a mechanism is required on a Layer 2 network to detect loops and notify the administrator.

Loopback detection is such a mechanism. It sends detection packets from an interface at intervals and checks whether the packets are sent back to the interface. If the packets are sent back, a loopback occurs on the interface.

The Loopback protection function is off by default.

- Enable the Loopback protection function

| | |
|-------------------------------|---|
| Command | switchport loppback-detected |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> • Enter interface view. <p>Run: switchport loppback-detected</p> <p>Enter</p> |
| Example | <pre>Switch_config# interface gigaEthernet 0/1 switch_config_g0/1# switchport loppback-detected switch_config_g0/1#</pre> |

- Configuring loopback detected Time

| | |
|-------------------------------|--|
| Command | error-disable-recovery recovery-time TIME |
| Parameter Descriptions | <ul style="list-style-type: none"> • TIME :<300-3600s> -- Timeout in secends |
| Procedure | <ul style="list-style-type: none"> • Enter config view. <p>Run: error-disable-recovery recovery-time TIME</p> <p>Enter.</p> |
| Example | <pre>switch_config# error-disable-recovery recovery-time 200 switch_config#</pre> |

- Enable loopback detected recovery

| | |
|-------------------------------|--|
| Command | error-disable-recovery enable |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter config view. <p>Run: error-disable-recovery enable</p> <p>Enter.</p> |
| Example | switch_config# error-disable-recovery enable switch_config# |

- Checking the configuration.

| | |
|----------------|--|
| Command | show running-config |
| Example | <pre>Switch_config# show running-config Building configuration. Current Configuration: !version 1.1.3c_M28P_B4M_T0 ! hostname username admin password 0 admin ! no spanning-tree ! no snmp-server view interface GigaEthernet 0/1 spanning-tree cost 100 spanning-tree port-priority 160 spanning-tree link-type point-to-point spanning-tree portfast spanning-tree bpduguard enable spanning-tree bpdufilter enable spanning-tree guard root switchport loopback-detected --More--</pre> |

9 System Management Configuration

9.1 Port Mirroring Configuration

Packet mirroring copies the packets on a mirrored port (source port) to an observing port (destination port).

During network maintenance, maintenance personnel need to capture and analyze packets (for example, when there are suspicious attack packets). However, these operations always affect packet forwarding.

Packet mirroring copies packets on a mirrored port to an observing port so that you can analyze packets copied to the destination port by a monitoring device to monitor the network and rectify faults.

9.1.1 Port-based Mirroring Configuration

The device supports to configure the source interface and target interface of mirror, supporting 1 to 1 and many to 1 modes.

- Configuring source interface of mirror

| Command | <u>mirror session SPAN session number source interface interface type interface number mode</u> |
|------------------------|---|
| Parameter Descriptions | <ul style="list-style-type: none">· <u>SPAN session number</u>: SPAN session number, the value is 1 as default, modification is not supported.· <u>interface type</u> : interface type, including<ul style="list-style-type: none">GigaEthernet -- GigaEthernet interfaceTenGigaEthernet -- TenGigaEthernet interface· <u>interface number</u>: interface number, in the format as “0/port number”, the value of port number value is the port number of the switch. And it supports to choose more than one ports by the following methods.<ol style="list-style-type: none">1) - : port range, format as “1-24”2) , : multiple port numbers, format as “1,8”· <u>mode</u> : including three modes:<ol style="list-style-type: none">1) both: monitor received and transmitted traffic2) tx: monitor received traffic only3) rx: monitor transmitted traffic only |
| Procedure | <ul style="list-style-type: none">· Enter config view. Run: <u>mirror session SPAN session number source interface interface type interface number mode</u>Enter |
| Example | Switch_config# mirror session 1 source interface gigaEthernet 0/1 -24 tx Switch_config# |

- Configuring destination interface of mirror

| Command | <u>mirror session SPAN session number destination interface interface type interface number mode</u> |
|------------------------|--|
| Parameter Descriptions | <ul style="list-style-type: none">· <u>SPAN session number</u>: SPAN session number, the value is 1 as default, modification is not supported. |

| | |
|------------------|---|
| | <ul style="list-style-type: none"> · <u>interface type</u> : interface type, including GigaEthernet -- GigaEthernet interface TenGigaEthernet -- TenGigaEthernet interface · <u>interface number</u>: interface number, in the format as “0/port number”, the value of port number value is the port number of the switch. And it supports to choose more than one ports by the following methods. <ol style="list-style-type: none"> 1) - : port range, format as “ 1-24” 2) , : multiple port numbers, format as “1,8” · <u>mode</u> : including three modes: <ol style="list-style-type: none"> 1) both: monitor received and transmitted traffic 2) tx: monitor received traffic only 3) rx: monitor transmitted traffic only |
| Procedure | <ul style="list-style-type: none"> . Enter config view. <p>Run: <u>mirror session SPAN session number destination interface interface type interface number mode</u></p> <p>Enter</p> |
| Example | Switch_config# mirror session 1 source interface gigaEthernet 0/1-24 rx Switch_config# |

| | |
|-------------------------------|--|
| Command | <u>mirror session 1 destination interface gigaEthernet port number</u> |
| Parameter Descriptions | <ul style="list-style-type: none"> . <u>port number</u> : Ranges from 1~24 |
| Procedure | <ul style="list-style-type: none"> . Enter config view. <p>Run: <u>mirror session 1 destination interface gigaEthernet port number</u></p> <p>Enter</p> |
| Example | switch_config# mirror session 1 destination interface gigaEthernet 0/9 switch_config# |

- . Checking the configuration.

| | |
|----------------|---|
| Command | <u>show mirror session 1</u> |
| Example | <pre>Switch_config# show mirror session 1 Session 1 ----- Destination Ports:g0/0 Source Ports: RX Only: g0/1-24 TX Only: None Both: None Switch_config#</pre> |

9.2 SNMP Configuration

As a network management standard protocol used on TCP/IP networks, SNMP uses a central computer (NMS) that runs network management software to manage network elements.

In a large network, it is very difficult for network administrator to detect, locate and rectify the fault as the devices does not report the fault. This affects maintenance efficiency and increases maintenance workload. To solve this problem, equipment vendors have provided network management functions in some products. The NMS then can query the status of remote devices, and devices can send traps to the NMS in the case of particular events.

The device supports the following functions, Enable/disable SNMP function

- Configuring SNMP community permission, including
 - a) Read only
 - b) Read and write
- Configuring SNMP V3, The configuration includes the following procedures.
 - a) User name
 - b) Identity authentication, including MD 5, SHA
 - c) Verify password
 - d) Encryption protocol (optional), including 3des, aes and des
 - e) Encryption password
 - f) Read and write Mode, including ro (Read only) and rw (Read and write)

Configuring IP address of SNMP trap host

Following with the steps.

- Enable/disable SNMP function

| | |
|-------------------------------|-------------------------------------|
| Command | snmp-server view |
| Parameter Descriptions | Null |
| Command | no snmp-server view |
| Parameter | Null |

- Configuring SNMP community permission

- a) Read only

| | |
|-------------------------------|--|
| Command | snmp-server community SNMP community string ro |
| Parameter Descriptions | <ul style="list-style-type: none"> · <u>SNMP community string</u>: Name the SNMP community, supporting strings |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: snmp-server community SNMP community string ro Enter |
| Example | switch_config# snmp-server community 123 ro switch_config# |

- b) Read and write

| | |
|-------------------------------|--|
| Command | snmp-server community SNMP community string rw |
| Parameter Descriptions | <ul style="list-style-type: none"> · <u>SNMP community string</u>: Name the SNMP community, supporting strings |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: snmp-server community SNMP community string rw |

| | |
|----------------|---|
| | Enter |
| Example | switch_config# snmp-server community 12345 rw switch_config# |

- Configuring SNMP V3

| | |
|-------------------------------|--|
| Command | <u>snmp-server user</u> user name <u>auth</u> Identity Authentication verify password <u>priv</u> <u>Encryption Protocol</u> <u>Encryption Password</u> Read and Write Mode |
| Parameter Descriptions | <ul style="list-style-type: none"> · <u>user name</u>: supporting 31 strings · <u>Identity Authentication</u>: identity authentication, including MD 5, SHA · <u>verify password</u>: authentication password, the range of length is 8-32. · <u>Encryption Protocol</u>: including 3des, aes and des · <u>Encryption Password</u>: encryption password, the range of length is 8-32. · <u>Read and Write Mode</u>: including ro (Read only) and rw (Read and Write) |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: <u>snmp-server user</u> user name <u>auth</u> Identity Authentication verify password <u>priv</u> <u>Encryption Protocol</u> <u>Encryption Password</u> Read and Write Mode <p>Enter</p> |
| Example | switch_config# \$ user SNMP2 auth md5 s12345678 priv des des12345678 rw switch_config# |

- Configuring SNMP V3 host

| | |
|-------------------------------|---|
| Command | <u>snmp-server host</u> IP address |
| Parameter Descriptions | <ul style="list-style-type: none"> · <u>IP address</u>: IP address of SNMP trap host |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: <u>snmp-server host</u> IP address <p>Enter</p> |
| Example | switch_config# snmp-server host 192.168.1.2 switch_config# |

- Checking the configuration.

| | |
|----------------|---|
| Command | <u>show running-config</u> |
| Example | <pre>Switch_config# show running-config Building configuration. Current Configuration: !version 1.1.3c_M28P_B4M_T0 ! hostname username admin password 0 admin ! no spanning-tree ! no snmp-server view ! snmp-server host 192.168.1.1</pre> |

| | |
|---|--|
| | <pre> snmp-server community public ro snmp-server community private rw snmp-server user admin123 auth md5 12345678 priv des 12345678 ro mirror session 1 source interface GigaEthernet 0/1-24 rx --More-- </pre> |
| · Configuring SNMP Server contact information | |
| Command | snmp-server contact contact |
| Parameter Descriptions | <ul style="list-style-type: none"> · contact -- Text for mib object sysContact |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: snmp-server contact contact Enter. |
| Example | <pre> switch_config# snmp-server contact add-tel-name switch2_config# show running-config Building configuration... snmp-server contact add-tel-name ... switch_config# </pre> |
| · Configuring switch location information | |
| Command | snmp-server location location |
| Parameter Descriptions | <ul style="list-style-type: none"> · location:LINE -- Text for mib object sysLocation |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: snmp-server location location Enter. |
| Example | <pre> switch_config# snmp-server location aaadddd switch2_config# show running-config Building configuration... snmp-server contact add-tel-name snmp-server location aaadddd ... switch_config# </pre> |

9.3 NTP Management

Network Time Protocol (NTP) is a protocol for synchronizing clocks on the network.

NTP is mainly used to synchronize clocks of all the devices on the network. Users can configure NTP so that all the clocks on the network are synchronized soon with high precision, preventing errors and heavy loads of network administrators.

- Enable NTP and set the IP address of NTP server.

| | |
|----------------|--|
| Command | ntp server IP address |
|----------------|--|

| | |
|---|---|
| Parameter Descriptions | <ul style="list-style-type: none"> · <u>IP address</u>: the IP address of NTP server |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: ntp server IP address Enter |
| Example | Switch_config# ntp server 192.168.5.6 Switch_config# |
| · Set the time interval to query NTP server | |
| Command | ntp query-interval time interval |
| Parameter Descriptions | <ul style="list-style-type: none"> · <u>time interval</u>: the time interval to query NTP server, the value ranges from 1 min to 8640 mins (6 days). By default, the value is 1 min. |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: ntp query-interval time interval Enter |
| Example | Switch_config# ntp query-interval 10 Switch_config# |
| · Disable NTP | |
| Command | no ntp server |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: no ntp server Enter |
| Example | Switch_config# no ntp server Switch_config# |
| · Disable time interval to query NTP server | |
| Command | no ntp query-interval |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: no ntp query-interval Enter |
| Example | Switch_config# no ntp query-interval Switch_config# |

9.4 System Log Configuration

Logs of a specific module can be output to the log buffer, console, or log host. By default the log function is on.

The device supports output 8 levels of system log by default.

| Levels | Description | Command lines |
|---------------|-----------------------------------|----------------------|
| 0 | System is unusable | emergencies |
| 1 | Immediate action needed[| alerts |
| 2 | Critical conditions | critical |
| 3 | Error conditions | errors |
| 4 | Warning conditions | warnings |
| 5 | Normal but significant conditions | notifications |
| 6 | Informational messages | informational |
| 7 | Debugging messages[| debugging |

Using command lines, users can enable/disable the function, configuring the device to output logs to log buffer, log host or to the console, and setting the ouput log levels.

- Enable/ disable the log function

| | |
|-------------------------------|-------------------------------|
| Command | logging on |
| Parameter Descriptions | Null |
| Command | no logging on |
| Parameter Descriptions | Null |

- Configuring the device to output logs to the log buffer

- Configuring buffer size

| | |
|-------------------------------|---|
| Command | logging buffered logging buffer size |
| Parameter Descriptions | <ul style="list-style-type: none"> · logging buffer size: ranges from 4096 to 1048576 |
| Procedure | <ul style="list-style-type: none"> · Enter config view. · Run: <code>logging buffered logging buffer size</code> <p>Enter</p> |
| Example | <pre>switch_config# logging buffered 6000 switch_config#</pre> |

- Configuring log level. After setting, the device will only record the set level log and levels higher than it.

| | | | | | | | | | | | | | | | |
|-------------------------------|---|-------------|--------------------------|--------|-------------------------------|----------|---------------------------|--------|------------------------|----------|--------------------------|---------------|---|---------------|------------------------------|
| Command | logging buffered level | | | | | | | | | | | | | | |
| Parameter Descriptions | <p>level : level command line, including</p> <table> <tbody> <tr> <td>emergencies</td> <td>-- System is unusable[0]</td> </tr> <tr> <td>alerts</td> <td>-- Immediate action needed[1]</td> </tr> <tr> <td>critical</td> <td>-- Critical conditions[2]</td> </tr> <tr> <td>errors</td> <td>-- Error conditions[3]</td> </tr> <tr> <td>warnings</td> <td>-- Warning conditions[4]</td> </tr> <tr> <td>notifications</td> <td>-- Normal but significant conditions[5]</td> </tr> <tr> <td>informational</td> <td>-- Informational messages[6]</td> </tr> </tbody> </table> | emergencies | -- System is unusable[0] | alerts | -- Immediate action needed[1] | critical | -- Critical conditions[2] | errors | -- Error conditions[3] | warnings | -- Warning conditions[4] | notifications | -- Normal but significant conditions[5] | informational | -- Informational messages[6] |
| emergencies | -- System is unusable[0] | | | | | | | | | | | | | | |
| alerts | -- Immediate action needed[1] | | | | | | | | | | | | | | |
| critical | -- Critical conditions[2] | | | | | | | | | | | | | | |
| errors | -- Error conditions[3] | | | | | | | | | | | | | | |
| warnings | -- Warning conditions[4] | | | | | | | | | | | | | | |
| notifications | -- Normal but significant conditions[5] | | | | | | | | | | | | | | |
| informational | -- Informational messages[6] | | | | | | | | | | | | | | |

| | |
|------------------|---|
| | debugging -- Debugging messages[7] |
| Procedure | <ul style="list-style-type: none"> Enter config view. Run: logging buffered level Enter |
| Example | switch_config# logging buffered errors switch_config# |

- Configuring the device to output logs to log host

| | |
|-------------------------------|--|
| Command | logging host IP address of the logging host |
| Parameter Descriptions | <ul style="list-style-type: none"> <u>IP address of the logging host</u>: IP address of the logging host |
| Procedure | <ul style="list-style-type: none"> Enter config view. Run: logging host IP address of the logging host Enter |
| Example | switch_config# logging host 192.168.1.1 switch_config# |

- Configuring the device to output logs to the console

After setting, the device will only record the set level log and levels higher than it.

| | | | | | | | | | | | | | | | | | |
|-------------------------------|---|-------------|--------------------------|--------|-------------------------------|----------|---------------------------|--------|------------------------|----------|--------------------------|---------------|---|---------------|------------------------------|-----------|--------------------------|
| Command | logging console level | | | | | | | | | | | | | | | | |
| Parameter Descriptions | <ul style="list-style-type: none"> <u>level</u> : level command line, including <table> <tr> <td>emergencies</td> <td>-- System is unusable[0]</td> </tr> <tr> <td>alerts</td> <td>-- Immediate action needed[1]</td> </tr> <tr> <td>critical</td> <td>-- Critical conditions[2]</td> </tr> <tr> <td>errors</td> <td>-- Error conditions[3]</td> </tr> <tr> <td>warnings</td> <td>-- Warning conditions[4]</td> </tr> <tr> <td>notifications</td> <td>-- Normal but significant conditions[5]</td> </tr> <tr> <td>informational</td> <td>-- Informational messages[6]</td> </tr> <tr> <td>debugging</td> <td>-- Debugging messages[7]</td> </tr> </table> | emergencies | -- System is unusable[0] | alerts | -- Immediate action needed[1] | critical | -- Critical conditions[2] | errors | -- Error conditions[3] | warnings | -- Warning conditions[4] | notifications | -- Normal but significant conditions[5] | informational | -- Informational messages[6] | debugging | -- Debugging messages[7] |
| emergencies | -- System is unusable[0] | | | | | | | | | | | | | | | | |
| alerts | -- Immediate action needed[1] | | | | | | | | | | | | | | | | |
| critical | -- Critical conditions[2] | | | | | | | | | | | | | | | | |
| errors | -- Error conditions[3] | | | | | | | | | | | | | | | | |
| warnings | -- Warning conditions[4] | | | | | | | | | | | | | | | | |
| notifications | -- Normal but significant conditions[5] | | | | | | | | | | | | | | | | |
| informational | -- Informational messages[6] | | | | | | | | | | | | | | | | |
| debugging | -- Debugging messages[7] | | | | | | | | | | | | | | | | |

| | |
|------------------|--|
| Procedure | <ul style="list-style-type: none"> Enter config view. Run: logging console level Enter |
| Example | switch_config# logging console informational switch_config# |

- Configuring logging trap level

| | |
|-------------------------------|---|
| Command | logging trap LEVEL |
| Parameter Descriptions | <ul style="list-style-type: none"> LEVEL support levels as follow: emergencies -- System is unusable[0] |

| | |
|-------------------------------|---|
| | <ul style="list-style-type: none"> · alerts -- Immediate action needed[1] · critical -- Critical conditions[2] · errors -- Error conditions[3] · warnings -- Warning conditions[4] · notifications -- Normal but significant conditions[5] · informational -- Informational messages[6] · debugging -- Debugging messages[7] |
| Procedure | <ul style="list-style-type: none"> · Enter config view. <p>Run: logging trap LEVEL</p> <p>Enter.</p> |
| Example | switch_config# logging trap informational |
| · Checking the configuration. | |
| Command | show log |
| Example | <pre>Switch_config# show log 2020-08-20 18:00:15 [LINK-3-UPDOWN] Port GE0/23 Link Up! 2020-08-20 18:00:40 [CONFIG-5-WEB] User login successful - IP:192.168.1.191 Name :admin Switch_config#</pre> |

9.5 System Management

9.5.1 Restore the System

The device supports to restore the system remotely.

| | |
|-------------------------------|--|
| Command | delete |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter enable view. · Run: delete <p>Enter</p> |
| Example | <pre>Switch# delete Are you sure to reset factory default(y/n)? Switch# delete Are you sure to reset factory default(y/n)? Commit succeed, if you want to enable the configuration, will reboot! Switch# umount: can't remount ramfs read-only umount: devtmpfs busy - remounted read-only swapoff: /etc/fstab: No such file or directory The system is going down NOW! Sent SIGTERM to all processes Sent SIGKILL to all processes Requesting system reboot</pre> |

| | |
|--|---|
| | <p>Monitor version 1.06c is Booting.</p> <p>Hit ctrl+c to stop autoboot: 0</p> <p>.....</p> <p>Switch con0 is now available</p> <p>Press Return to get started.</p> |
|--|---|

9.5.2 Reboot the System

The device supports to reboot the system remotely.

| | |
|-------------------------------|--|
| Command | reboot |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter enable view. · Run: reboot <p>Enter</p> |
| Example | <p>Switch# reboot</p> <p>Do you want to reboot the Switch(y/n)?</p> <p>Switch# umount: can't remount ramfs read-only</p> <p>umount: devtmpfs busy - remounted read-only</p> <p>swapoff: /etc/fstab: No such file or directory</p> <p>The system is going down NOW!</p> <p>Sent SIGTERM to all processes</p> <p>Sent SIGKILL to all processes</p> <p>Requesting system reboot</p> <p>Restarting system.</p> <p>Monitor version 1.06c is Booting.</p> <p>Hit ctrl+c to stop autoboot: 0</p> <p>.....</p> <p>.....</p> <p>.....</p> <p>Switch con0 is now available</p> <p>Press Return to get started.</p> |

9.5.3 File Management

The device can do as a server or client to manage files.

When the device functions as a server, you can access the device on a terminal to manage files on the device and transfer files between the device and the terminal.

When the device functions as a client, you can use the device to manage files on other devices and transfer files between the device and other devices.

- Copy file from tftp server

| | |
|-------------------------------|--|
| Command | copy tftp: file name flash: |
| Parameter Descriptions | <ul style="list-style-type: none"> · <u>file name</u>: the name of file that to be copied |

| | |
|--------------------------------------|--|
| Procedure | <ul style="list-style-type: none"> Enter enable view. <p>Run: copy tftp: file name flash:</p> <p>Enter</p> |
| Example | <pre>switch# copy tftp:11.img flash: Address or name of remote host []? 192.168.1.1 Source filename [11.img]? Destination filename [11.img]? please wait. 11.img 100% ***** 11852k 0:00:00 ETA It is very dangerous to update IOS, are you sure(y/n)? switch#</pre> |
| · Copy file from system flash memory | |
| Command | copy flash:file name tftp: |
| Parameter Descriptions | <ul style="list-style-type: none"> <u>file name</u>: the name of file that to be copied |
| Procedure | <ul style="list-style-type: none"> Enter enable view. <p>Run: copy flash:file name tftp:</p> <p>Enter</p> |
| Example | <p>Example 2 Copy file from system flash memory</p> <pre>Switch# copy flash: tftp: Address or name of remote host []? 192.168.1.100 Source filename []? SZ56150M.bin Destination filename [SZ56150M.bin]? please wait. SZ56150M.bin 100% ***** 13824k 0:00:00 ETA finish. Switch#</pre> |

The device can do as a server or client to manage files.

When the device functions as a server, users can copy startup configuration file.

| | |
|-------------------------------|---|
| Command | copy startup-config tftp: |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> Enter enable view. <p>Run: copy startup-config tftp:</p> <p>Enter</p> |
| Example | <pre>Switch# copy startup-config tftp: Address or name of remote host []? 192.168.1.100 Destination filename [startup_config]? 22.cfg 22.cfg 100% ***** 1252 0:00:00 ETA Building configuration.</pre> |

9.6 User Setting

The switch manages users at levels. User levels are marked by numbers from 1 to 15, in ascending order. The access privilege of user is determined by the level of this user.

| | |
|-------------------------------|---|
| Command | username user name privilege privilege level password password |
| Parameter Descriptions | <ul style="list-style-type: none"> · <u>user name</u>: user name, the length should be less than 16. · <u>privilege level</u>: privilege level, the value ranges from 1 to 15. · <u>password</u>: password, the length should be less than 16. |
| Procedure | <ul style="list-style-type: none"> · Enter config view. · Run: username user name privilege privilege level password password Enter |
| Example | Switch_config# username admin123 privilege 15 password 123456789 Switch_config# |

9.7 LLDP Configuration

Based on Layer 2 information obtained using LLDP, the NMS can quickly detect configuration conflicts between devices and locate network faults. Users can use the NMS to monitor link status of LLDP-enabled devices and quickly locate faults on the network.

The function is on by default, and the default hold time is 120s.

- Enable/disable LLDP function

| | |
|-------------------------------|--------------------------------|
| Command | lldp enable |
| Parameter Descriptions | Null |
| Command | no lldp enable |
| Parameter Descriptions | Null |

- Configuring LLDP timer

- Hold time

The time that the receiver must keep the packet.

| | |
|-------------------------------|---|
| Command | lldp holdtime hold time |
| Parameter Descriptions | <ul style="list-style-type: none"> · <u>hold time</u>: ranges from 0 to 65535s. |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: lldp enable Enter · Run: lldp holdtime hold time Enter |
| Example | switch_config# lldp enable switch_config# lldp holdtime 160 switch_config# |

- Interval time

When the LLDP status of the device keeps unchanged or the device does not discover new neighbors, the device sends LLDP packets to the neighbors at a certain interval.

| | |
|-------------------------------|--|
| Command | lldp timer interval time |
| Parameter Descriptions | <ul style="list-style-type: none"> · <u>interval time</u>: ranges from 0 to 65535s. |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: lldp enable Enter · Run: lldp timer interval time Enter |
| Example | <pre>switch_config# lldp enable switch_config# lldp timer 200 switch_config#</pre> |

c) Enable/Disable LLDP receive

| | |
|-------------------------------|---|
| Command | (no) lldp receive |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter interface view. Run: (no)lldp receive Enter. |
| Example | <pre>switch_config# interface gigaethernet 0/24 switch_config_g0/24# lldp receive switch_config_g0/24# no lldp receive switch_config_g0/24#</pre> |

d) Enable/Disable LLDP transmit

| | |
|-------------------------------|--|
| Command | (no) lldp transmit |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter interface view. Run: (no)lldp transmit Enter. |
| Example | <pre>switch_config# interface gigaethernet 0/24 switch_config_g0/24# lldp transmit switch_config_g0/24# no lldp transmit</pre> |

e) Show lldp neighbors list

Display information about neighbors, including device name, interface type and number, holdtime, port ID, and capabilities.

| | |
|-------------------------------|--|
| Command | show lldp neighbors |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter config view. |

| | |
|----------------|---|
| | <p>Run: show lldp neighbors</p> <p>Enter.</p> |
| Example | <pre>switch_config# show lldp neighbors Capability Codes: (R)Router,(B)Bridge,(C)DOCSIS Cable Device,(T)Telephone (W)WLAN Access Point, (P)Repeater,(S)Station,(O)Other Device Local_port Holdtime Port-ID Capability MS400980M Ge0/5 109 Ge0/4 B Total entries displayed: 1 switch_config#</pre> |

9.8 Hostname Configuration

Hostname is the name of the switch. The hostname can be edited by user.

The factory default hostname is switch.

| | |
|-------------------------------|---|
| Command | <code>hostname hostname</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> · <code>hostname</code> -- Name of switch |
| Procedure | <ul style="list-style-type: none"> · Enter config view. <p>Run: <code>hostname hostname</code></p> <p>Enter.</p> |
| Example | <pre>switch_config# hostname switch2 switch2_config# show running-config Building configuration ... hostname switch2 ... switch2_config#</pre> |

9.9 System Time Configuration

System time is the time on the switch and it can be edited.

| | |
|-------------------------------|--|
| Command | <code>clock set HH:MM:SS DAY MONTH YEAY</code> |
| Parameter Descriptions | <ul style="list-style-type: none"> · <code>HH:MM:SS:</code> -- Set time · <code>DAY</code> -- Set day(1-31) · <code>MONTH</code> -- Set month(1-12) · <code>YEAY</code> -- Set year(2000-2035) |
| Procedure | <ul style="list-style-type: none"> · Enter enable view. |

| | |
|----------------|--|
| | Run: clock set HH:MM:SS DAY MONTH YEAY Enter. |
| Example | switch# clock set 18:27:11 14 11 2023 Tue Nov 14 18:27:11 UTC 2023 switch# show clock 18:27:14 GMT+3 Tue Nov 14 2023 switch# |

9.10 Timezone Configuration

Timezone can be edited and it is shown where the switch is installed.

| | |
|-------------------------------|---|
| Command | clock timezone NAME TIMEZONE |
| Parameter Descriptions | <ul style="list-style-type: none"> · NAME:WORD -- Name of time zone · TIMEZONE:<-12 - +12> -- Hours offset from UTC |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: clock timezone NAME TIMEZONE Enter. |
| Example | switch_config# clock timezone dd1 +8 switch_config# |

9.11 Login Method

User authentication enables configuration access via Telnet, SSH, and HTTP. These protocols provide secure remote management, ensuring authorized users can configure and manage network settings efficiently.

- Enable Telnet Server

| | |
|-------------------------------|---|
| Command | telnet-server |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: telnet-server Enter. |
| Example | switch_config# telnet-server |

- Enable SSH Service

| | |
|-------------------------------|--|
| Command | ssh enable |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none"> · Enter config view. Run: ssh enable Enter. |
| Example | switch_config# ssh enable |

- EnableHttpsService

| | |
|-------------------------------|--|
| Command | ip https server |
| Parameter Descriptions | Null |
| Procedure | <ul style="list-style-type: none">· Enter config view. Run: ip https server Enter. |
| Example | switch_config# ip https server |

10 Network Diagnosis

10.1 Ping Operation with IPv4

User login on a switch allows for the functionality of pinging devices, verifying network connectivity and troubleshooting issues via IPv4 ping in IPv4 network, ensuring seamless communication across the network infrastructure.

| | |
|-------------------------------|---|
| Command | <code>ping TARGET</code> |
| Parameter Descriptions | <ul style="list-style-type: none">TARGET: IP address or domain name |
| Procedure | <ul style="list-style-type: none">Enter config view.Run: <code>ping host</code>Enter. |
| Example | <code>switch_config# ping 192.168.1.100</code> <code>switch_config# ping www.google.com</code> |

10.2 Ping Operation with IPv6

User login on a switch allows for the functionality of pinging devices, verifying network connectivity and troubleshooting issues via IPv6 ping in IPv6 network, ensuring seamless communication across the network infrastructure.

| | |
|-------------------------------|--|
| Command | <code>ping ipv6 TARGET</code> |
| Parameter Descriptions | <ul style="list-style-type: none">TARGET: x:x:x:x:x:x:x:x -- IPv6 address |
| Procedure | <ul style="list-style-type: none">Enter config view.Run: <code>ping ipv6 TARGET</code>Enter. |
| Example | <code>switch_config# ping ipv6 200::12</code> <code>switch_config#</code> |

10.3 Using IP Traceroute

Traceroute is a diagnostic tool that traces the path packets take through a network. It identifies network hops, measures latency, and identifies connectivity issues, helping troubleshoot and optimize network performance. Traceroute aids in understanding network topology and locating bottlenecks for efficient troubleshooting.

You can use IP traceroute to identify the path that packets take through the network on a hop-by-hop basis.

| | |
|-------------------------------|---|
| Command | <code>traceroute host</code> |
| Parameter Descriptions | <ul style="list-style-type: none">host:WORD -- Trace route to destination address or hostname |
| Procedure | <ul style="list-style-type: none">Enter enable view.Run: <code>traceroute host</code>Enter. |
| Example | <code>switch# traceroute 192.168.3.214</code> |

| | |
|--|---|
| | Flags: ... |
| | -----+-----+ |
| | traceroute to 192.168.3.214 (192.168.3.214), 30 hops max, 38 byte packets |
| | 1 192.168.3.214 (192.168.3.214) 2.190 ms 0.569 ms 0.553 ms |
| | switch# |

traceroute to 192.168.3.214 (192.168.3.214), 30 hops max, 38 byte packets

1 192.168.3.214 (192.168.3.214) 2.190 ms 0.569 ms 0.553 ms

switch#
